At the Baliol mine, east of Sutter Creek, on the old Marre ranch of 230 acres, the present working shaft is one-fourth mile from the mill. There are five parallel ledges in Baliol ground, on one of which the present shaft is down 450 feet; sinking continues. Ore to supply the 40-stamp mill was taken out of open cuts from the different ledges, as well as from tunnels and from the 200 and 300 levels of the shaft. The main ledge is 40 feet wide in many places, and as a low-grade proposition could all be worked. Exploration is now going on, however, to develop high-grade shoots or chimneys, and the mill is temporarily idle. The mill, erected in 1896-97, is equipped with forty 1000-pound stamps, sixteen concentrators, etc., and is run by water under a head of 452 feet, or 200 pounds pressure to the square inch. A 75 H. P. air compressor, also run by water, and controlled by an automatic regulator, sends air to the hoisting works, where from the receiver it is taken into a set of old steam boilers and re-heated before being used in the 30 H. P. hoisting engine and in the power drills in the mine. The shaft is double compartment and well timbered. Buckets are used, but the headgear is equipped with a cage to assist in an automatic dumping arrangement. Besides developing the various levels from the shaft, the company is also developing a vein which it was intended to follow in the old Marre tunnel. The projectors of this tunnel missed the vein. Recently Supt. Porter started a crosscut east from the face of the tunnel. Within 2 feet the vein was struck, at a point where a rich shoot existed. A winze has been sunk 25 to 30 feet on this shoot, in a 10-foot vein, and it holds good, thus giving promise of being one of the most valuable parts of the property. S. R. Porter is manager of the Baliol and of the Mutual, both near Sutter Creek; J. E. Dickieson, accountant; J. B. Weston, foreman of Baliol mill; A. C. Morehead, foreman of mine.

Sutter Creek, Feb. 20.

BUTTE COUNTY.

The Bloomer Hill M. Co. of San Francisco has finished a ditch eleven miles long carrying water from Berry creek to the quartz mine. Next month the company proposes to put in a 40-stamp mill. The ore runs from $2 to $8 per ton.

CALAVERAS COUNTY.

Record: The Lost Log mine, near Milton, is working steadily, the shaft being 240 feet deep on a 30-foot vein of good ore. Six men are at work.

CONTRA COSTA COUNTY.

A smelter is projected at Bull Point, near Martinez, by French capital, the plant to include a modern refinery for the handling of base ores.

EL DORADO COUNTY.

A 20-stamp mill is being put up at the Union mine, Placerville.

LASSEN COUNTY.

B. Talbot has driven a tunnel 100 feet on a ledge varying from 20 inches to 3 feet in thickness. Arrangements have been made for a 5-stamp mill as soon as the machinery can be brought over Diamond mountain to the Plumas side.

MARIPOSA COUNTY.

The Tendron mine of Whitlocks has closed down.

NEVADA COUNTY.

The Grass Valley Exploration Co. has filed three suits in the U. S. Circuit Court against the Pennsylvania Con. M. Co., owner of adjoining property. Plaintiff alleges that the defendant has infringed on the property of the plaintiff and asks $100,000 damages.

Grass Valley reports that the Red Ledge mine is employing fifteen men and that the mill started Feb. 17.

PLACER COUNTY.

The Esperanza mine, Garden Valley district, will resume operations, Robert Harrop Supt.

The machinery has been taken out of the Hathaway mill. Supt. A. B. Eastwood has returned from San Francisco, where he had gone for new machinery.

Sentinel: Work will be resumed in the Golden West mine, owned by R. H. Lloyd of San Francisco. J. B. Knapp has charge of the property. The work will be contracted. This mine is five miles south of Blue Canyon.

PLUMAS COUNTY.

(Special Correspondence).—Scarcely any snow lies at the Diadem mine at an altitude of 4750 feet, and but little on the high mountains in sight. Precipitation there for the season, 51 inches, or about two-thirds of the average for a whole season.

Meadow Valley, Feb. 21.

The Yankee Hill mine, near La Porte, under management of D. La Plante, has closed down.

Eight stamps at the Cresent mill are being run, mainly on custom ore from the Empire mine.

Independent: The De Long M. Co. have an elevator in operation at the Marietta mine. it raises the gravel 37 feet through heavy iron pipe. A 2½-inch nozzle, under pressure of 150 feet, moves the gravel, boulders being moved by a derrick. Eighteen men are employed.——C. D. Hazzard and M. A. Delano of San Francisco have been examining the Plumas Imperial and North Fork mines, near Quincy.

RIVERSIDE COUNTY.

The Star Wano M. Co. has been incorporated at Corona, capital stock $250,000.

SAN DIEGO COUNTY.

The Barona Copper Mining and Smelting Co. has incorporated, capital stock $500,000, to develop copper at San Vicinte.

The San Juan Tin M. & S. Co.'s mines at San Vicente has incorporated, capital stock $1,000,000.

SISKIYOU COUNTY.

The Siskiyou G. & C. M. Co., J. W. Martin Mgr., is arranging to start up in March

and is considering the building of a water jacket smelter.

A Postlethwaite dredger is building on Yreka creek and expected to be running in sixty days.

TUOLUMNE COUNTY.

(Special Correspondence).—The Tuolumne mine is owned in Soulsbyville. The last ore milled from the mine paid $125 per ton; sulphurets assay $300 per ton.

The Wheel Perrin mine is idle. Ore from this mine has paid $60 in free gold; the sulphurets are high grade. They have a hoisting and pumping plant on the mine.

The Soulsby mine is expected to resume. It is in granite formation, has yielded considerable and, with capital and good management, can be brought to the front.

Soulsbyville, Feb. 20.

Independent: The Sunrise mine at Pine Log will be started up under new management.——The Bonanza shaft has been unwatered.

Mother Lode: All the mines near Tuttletown are working steadily. —— The Shawmut mine has nearly 200 men on its payroll.——The Calico mine of Stent has been incorporated and will be worked on a large scale. The flow of water is large in this mine.——The machinery for the 60-stamp mill of the Harvard mine is arriving. The battery blocks are being placed. ——At the Rhode Island mine, Groveland, a three-compartment shaft is down about 100 feet, operating with a two-horse whim. Hoisting machinery will be in operation in about six weeks. S. Carlin is Mgr.

COLORADO.

ARAPAHOE COUNTY.

The Emanuel Fuse Works will build a $100,000 plant in Denver, to be completed within three months.

EL PASO COUNTY.

The Colorado-Philadelphia Reduction Works will build at Colorado City a new chlorination mill at a site to be later determined.

Colorado Springs men will buy the Great Western kieselgore mine, Carlin, Nevada, and erect a plant in Colorado Springs for the manufacture of giant powder, nitro-glycerine and other substances; consideration $50,000. The mineral is used in the manufacture of giant powder, nitro-glycerine and as a plastic for covering steam and hot water pipes. It is also a substitute for asbestos and is employed in the construction of battle ships and large sailing vessels.

Mining Record: Ninety thousand dollars cash has been offered for the Favorite claim on Bull hill and the offer has been accepted on condition that the stockholders ratify the sale.

Mining Record: The Colorado Springs Mining Stock Exchange will contribute $1500 toward a fund to have quotations of 100 stocks represented on that board posted daily on the grounds of the Paris Exposition.

LAKE COUNTY.

The mining rights under the Union smelter plant, Leadville, have been acquired by the Maple Street M. & M. Co., newly organized with capitalization of $1,250,000. A shaft or diamond drill hole will be sunk.

The old Silver Cord mine, of which A. A. Blow, now in South Africa, was manager, is to be worked through the Yak tunnel.

Post: The Maid and Henriett, Leadville, is now worked almost entirely by lessees.

PARK COUNTY.

The Fairplay placer, Fairplay, has been sold to Cincinnati men, who will equip it on an extensive plan under the management of T. R. Miller.

PITKIN COUNTY.

Aspen Tribune: Despite the increase in milling capacity of 400 tons per day in Cripple Creek district, an increase at Leadville of 350 tons per day, besides the blowing in of nearly all idle smelting plants in the State, the production will exceed the combined smelting and milling capacity by over 1000 tons per day before the end of the year. To meet this is figured an increase in the pyritic smelter from 350 to 1000 tons per day. This will relieve the lead smelters of a large sulphide ore tonnage. The 500-ton Dorsheimer-Joralman smelter and a possibility of the 300-ton Rocky Mountain smelter at Florence being built, with the 350-ton mill now in course of construction at Florence, and the increased capacity of the Metallic Extraction Co.'s plant and of the Woods 350-ton mill, will give producers relief in the latter part of the year.

SAGUACHE COUNTY.

The Parkhill Smelting Co. has incorporated in Denver, capital stock $2,500,000, to acquire by purchase and operate the smelting and refining works of the New York Smelting Co. at Parkhill; incorporators, D. G. Weems, G. W. Hoyt, T. H. Baldwin.

SAN JUAN COUNTY.

Dr. P. M. Pascoe proposes to build a pyritic smelter at Silverton.

SAN MIGUEL COUNTY.

The new cyanide plant at Pandora is in operation. It is a 100-ton plant for the tailings strung along the river below the Pandora mill.

The Carribeau mine, near Ophir, is reported sold to the Venture corporation for $350,000.

Examiner: The Tomboy at Telluride is making improvements at mine and mill. ——The Japan will enlarge its milling capacity, increase its output and open additional ground. It is located near the Tomboy. —— The Special Sessions and twenty others in the district will be worked this season.

SUMMIT COUNTY.

Breckinridge reports that three of the four dredgers owned by the North American Gold Dredging Co. at that place are to be removed to other points, not because of failure but the result of changes in management. One dredger will be operated at Breckinridge next summer.

TELLER COUNTY.

Spencer Penrose, C. L. Tult and C. M. MacNeill project a new $750,000 mill for the Cripple Creek district, to be probably located at Canyon City.

W. S. Stratton has bought the Favorite on Bull hill, adjoining the Logan and American Eagle, on a basis of $115,000.

IDAHO.

IDAHO COUNTY.

Review: The Big Buffalo group of Buffalo Hump the past season sunk a 70-foot shaft and drifted 135 feet on the vein. The ore body in the bottom is not of any higher grade than that encountered on the surface. A crosscut from the face of the drifts discloses nearly 40 feet of solid ore. A sample selected by mining men shows a value of the ore body of $15.90 per ton in gold. Seven feet of ore on the hanging wall averages $40 per ton in gold. Half of this property is owned by the original locators and the other half by Clark & Sweeny of Spokane.

NEZ PERCES COUNTY.

A smelter at Lewiston is projected.

OWYHEE COUNTY.

About ninety men are employed on the Black Jack mine, and it is running as vigorously as before the shut-down last summer.

The South Oro Fino mine, on War Eagle, formerly known as the Golden Chariot, has been sold to the War Eagle Con. M. Co., the bond being taken up and the money paid over.

MICHIGAN.

HOUGHTON COUNTY.

A 4-head stamp mill is to be built for the Baltic mine, to cost $60,000.

A new hoisting plant will be installed at No. 4 shaft, Atlantic mine.

MONTANA.

CLARKE COUNTY.

Independent: F. Harrington, of Butte, bonded the Majestic group, an extension of the Boss Tweed and Clipper groups, between them and the Leviathan group at Mammoth.——The pumps in the Waterlode mine at Red Bluff have been pulled and the work suspended.—— Work has been suspended at the property of the High Ore Gold & Copper M. Co.

DEER LODGE COUNTY.

M. Daly has bought the French gulch placers, near Anaconda, and will have several large dredgers built for their operation.

Standard: An important mine of the Anaconda Co. is the Mountain Consolidated. The mine is worked through two shafts; the first is down 2000 feet and the second has reached a depth of 1600 feet, making the mine the deepest in the district, with the exception of the Green Mountain. At No. 1 shaft is the great upright engine built by the Union Iron Works of San Francisco, and known as the Aztec. It is the companion of the Modoc, at the Never Sweat, of about 2700 H. P. At this mine the gallows-frame is of timber, and the hoisting is done with four-deck cages—four cars of ore being hoisted at a time. It is raised and dumped through a chute into a bin 40 feet below. Here it is loaded into horse cars, which approach the bin through a tunnel, and taken to the main railroad dump, about 250 or 300 feet. At this mine are two air compressors. The boiler plant consists of eight sets, aggregating 1000 H. P. At shaft No. 2 is nothing but a hoist. The engine is double-acting, of about 500 H. P. The hoisting is done with double-deck cages and steam is furnished by the boiler plant at the main shaft. The timber framing is also done there, the finished timbers being sent down by a compressed air tram. At this mine an immense quantity of timber is used. For January it is estimated at 450,000 feet. The mine is yielding largely—an average of about 750 tons per day. Six hundred men are employed. J. Keegan is Supt.

FLATHEAD COUNTY.

The concentrator at the Snowshoe, near Libby, starts April 1. About eighty men will be employed.

LEWIS AND CLARKE COUNTY.

The Drum Lummon mine at Marysville produces more money in a year than any agricultural county in the Mississippi valley.

A 40-stamp mill will be built at the mines owned by L. S. Woodbury of Great Falls at York.

NEVADA.

ELKO COUNTY.

Work will be resumed in the Tuscarora Chief, at Tuscarora. There are 10,000 tons of tailings of an average value of $8 in gold.

WASHOE COUNTY.

Silver State: The Reno Reduction Works have been started up again.

WHITE PINE COUNTY.

News: W. B. Lawler of Oregon, who has been investigating Cherry Creek mines, has bought the Watson Bros. group and put three shifts on.——I. Quinn, foreman Star mill, reports the mill running with plenty of ore.—— The American Victor mine, which was bought by Salt Lake men about a year ago and abandoned, is being developed by the original owners, who have shipped a consignment of ore which netted $150 a ton.——W. S. Brown, of Salt Lake, has been investigating mining properties at Cherry Creek. Mr. Brown owns mining interests in Tuscarora, Mercur and Bingham.

NEW MEXICO.

COLFAX COUNTY.

New Mexican: The Confidence properties in the Elizabethtown district are being developed.——J. B. Wheeler, of Colorado Springs, will overhaul the mill at Baldy this spring and start work on the Moale and French Henry.——The Black Horse mine at Elizabethtown has the longest tunnel and the deepest shaft in the Elizabethtown district. The tunnel is in 1700 feet, and the shaft is down 340 feet.

DONA ANA COUNTY.

New Mexican: The Humphrey-Connor group at Gold camp have been patented. ——A concentrating plant is to be erected on the Oriental in Gold camp.——The Black Prince, at Gold camp, in the Organ mountains, has been bonded to Kansas City men.

GRANT COUNTY.

New Mexican: Hanover is to have a smelter this year.——The smelter at Pinos Altos is being put in shape for resumption of work.——The shaft of the Pacific Gold Co. at Pinos Altos is being sunk to the 800-foot level.

SIERRA COUNTY.

New Mexican: Senator Andrews asks $1,000,000 for the Trippe mine at Andrews. ——A strike of silver ore has been made in the Cabello mountains.——Cleveland parties are examining the manganese iron deposits around Hillsboro.——The Walker M. & M. Co. are making arrangements to put in larger reduction works at Grafton. ——Buchanan & Baker of St. Louis, for the company that owns the El Dorado near Hillsboro, are putting the property in shape for the resumption of operations.

OREGON.

JOSEPHINE COUNTY.

At Grant's Pass, B. E. Meredith, Supt. Wilson placer mine, on the Illinois river, is piping day and night, with a good head of water.

The Big Yank M. & M. Co. is under the management of J. F. Wickham. Fifteen men are employed at the mine.

At the Eureka mine work goes steadily on. They are getting out ore and storing the same until they can pack in a new mill of ten stamps.

At the A. & B. placer mine, Galice creek, the break of 300 feet in the flume, caused by a landslide, has been repaired, and two giants are at work.

SOUTH DAKOTA.

LAWRENCE COUNTY.

Deadwood reports that the Bingham mine is bonded to John Pierce of Sioux City, Ia. It is in the North Lead district.

J. Simmons of Deadwood is appointed assayer for the Colorado & Deadwood M. Co.

Extensive sampling is being done at the Gilt Edge mine, near Deadwood, preparatory to resuming work.

Joseph Underwood, Mgr. Boston & South Dakota M. Co., in the Blacktail district, near Deadwood, says it is decided to put in a cyanide annex at the stamp mill.

It is probable a custom cyanide plant of 100 tons capacity will be built near Deadwood this season. Plans for such a plant are being prepared.

Mining Review: The Star shaft, Homestake mine, has reached a depth of 1130 feet, making it the deepest shaft in the Black Hills.

Times: The rich ore encountered in the Holy Terror mine was in the north drift on the 500-foot level, on the ground that was bought from the Keystone. It is a continuation of the Holy Terror vein.—— A deep shaft is being started on the New Eldorado mine, near Hill City. Dr. Peters of New York has an option on the property and is putting in air compressor and other improved machinery.

UTAH.

EMERY COUNTY.

Mining Review: The Azurite Copper M. Co., operating copper properties in Emery county, arrived at the Taylor & Brunton sampler with their initial car of Azurite ore. The test shipment was better than anticipated, showing 12.5% copper. Development will be pushed as fast as possible, and probably a leaching mill will be built in the spring. The property consists of fifteen claims located along the sand reef within four miles of Green river.

MILLARD COUNTY.

(Special Correspondence).—The Charm mine, thirty miles west of Oasis, has a 320-foot shaft, 700 feet of crosscuts and drifts, 300 feet of winze work, a 150-foot upraise and has a good showing of gold and copper ore.

SALT LAKE COUNTY.

(Special Correspondence).—Bingham district: The Old Jordan & Galena, one of the properties of the U. S. group, has made a fine showing of surface improvements within the past eight months. A machine shop has been equipped and in the engine room a new 100 H. P. compressor is in operation, supplying compressed air for the drills, hoists, pumps, and from which air is conveyed through a 4-inch pipe to the Old Telegraph group, four miles distant, supplying the air drills and pumps at the latter mine. A four-story rooming house, for the employes, eighty rooms, steam-heated, electric-lighted, with bath rooms and other conveniences, has been completed. At the Old Telegraph, also one of the U. S. group, a large rooming house, similar to the one just described, has been built, as well as other buildings that make the surface equipment substantial and complete.

The Shawmut mine, located in Carr fork gulch, a short distance above the town of Bingham, is being developed under the management of Geo. B. Earnshaw, formerly of Montana and California. Present development is through a tunnel, but preparations are being made for putting up hoisting machinery and sinking an incline shaft from the surface, following the dip of the vein. The ores thus far disclosed are sulphides of iron and copper, carrying copper, silver and gold values. Mr. Earnshaw states that a contract is being let to erect a 100-ton concentration mill to run on Shawmut ores. It will be located in the town of Bingham.

The Red Wing has a location on the mountain side, several hundred feet south of the main Bingham canyon and near town. A tunnel cuts westward about 100 feet, crosscutting the ledge of ore trending north and south. The work drifts on the vein some 700 feet northward, following the smooth, sharply-defined hanging wall the entire distance. The first 200 or 300 feet of this drift is in a mineralized gangue that is said to average 8% copper, considerable of which has been shipped to the smelters direct. As the drift has proceeded northward the ledge appears to lose its copper characteristics, but this loss is compensated for by coming into a widening body of galena, running from 30% to 60% in that material, as well as high values in silver. These ores are carried by a black lime gangue. The Red Wing Co. owns a concentration mill several hundred feet from the mine, which is running on Red Wing ores at the rate of sixty tons per day. To indicate the extent of work, it may be stated that the ledge is being worked three sets wide at the north end and the stopes at present extend six sets high. Fred Lewis is foreman.

The Dexter group, in the lower part of town, was opened twenty-eight years ago, and was worked successfully at the time the old Winnemuck smelter was operating. In those days the workings were confined to within 100 to 150 feet of the surface, and the product was rich lead carbonates. Some years ago additional work was done by C. W. Watson and others, who followed the ledge along the hanging wall some 400 feet on an incline, getting into the sulphides. It is estimated the property has produced $500,000 in silver-lead ore. It is now in the hands of J. H. Stallings, J. T. Hudson and G. L. Bemis, who have a bond thereon, and who apparently intend taking up the bond.

Mr. Bemis is in charge. A new hoisting plant has been erected and twenty men are employed. At each 100-foot station, on the 400-foot incline, a drift is run in opposite directions on the ledge, from which it is seen the old workings were kept close to the hanging wall, without any attempt to penetrate the strata toward the foot wall. The plan of the management is to run crosscuts to determine thickness of ore body. Much ore exposed by present workings runs about 50% lead and ten ounces silver and small values in gold. It is expected that production will begin next month. Bemis Bros. own the Dewey mill, in the canyon, which is new and capable of concentrating 150 tons per day, being equipped with crusher, rolls, sizers, jigs and vanners. It is thought it will soon start up on Dixon ore.

The Midland group of seven claims, joining the Fortune grounds, is being opened by a crosscut tunnel, which is now in 800 feet, and which will soon reach the Fortune vein. This group has produced about $150,000 worth of ore, but mainly from surface workings. G. L. Bemis and others are owners of the Midland.

The West Mountain placer property is being operated by Messrs. Watson and others, with Dan Clays in charge.

The Boston Con. M. Co. are sinking a winze from the Phœnix tunnel, 400 feet from the entrance. The work of driving the Armstrong tunnel from the Carr fork side is in progress, as is also similar work in a tunnel on the opposite side of the mountain by the same company.

The Highland Boy mine delivers about 200 tons of ore per day to the ore bins at the R. G. W. R. R. station, a distance of about three miles, by means of an aerial tramway. It is estimated their ores will average 8% copper, besides which there are fair values in gold and silver.

On the Columbia group, belonging to F. B. Cook and associates, three parallel veins exist, there being 500 feet of drifting on one known as the What-cheer. The group embraces fifteen claims and end lines with the Fortune on the north. There is a porphyry displacement near the end lines which changes the regular course of the lodes. The country rock is an altered gray porphyry, highly siliceous, which is lightly mineralized with copper. The veins wave considerably, have a dip of 30° and carry a uniform value of about 2% copper, and from $2 to $3 gold and silver. The drifts follow the hanging wall, no foot wall having been found.

WASCOTT.

Bingham Canyon, Feb. 17.

The old Winnemuck property, a group of eight patented claims, was bought by James Campbell of California. Included is the old mill and hoisting and pumping machinery set up several years ago. The workings are 400 feet deep and it is stated good ore reserves are ready for shipment. Mr. Campbell intends to begin at once to re-equip the mill and bring it up to the standard of a modern concentrator, with 150 tons capacity. He will also prepare to sink deeper and thoroughly open the mine. He states that he has 100,000 tons of ore on various dumps which will bear concentrating. Mr. Campbell was identified with mining in Bingham Canyon twenty-five years ago.

The Bingham Gold & Copper Co., Col. Heffron Mgr., have advanced 1100 feet with their tunnel which is being driven to cut the edge. On the opposite side of the mountain are extensive workings, opened years ago when the mine was known as the Commercial. The old tunnel, on the Commercial side, cuts the ledge at about the line between the oxidized and sulphide ores, and the production in former years was chiefly from the oxidized section. From the old tunnel an incline follows the ledge down over 300 feet, through which much sulphide ore was produced. The workings, in drifts and crosscuts on this side, aggregate 2000 feet. The new tunnel, being driven toward the dip of the vein, and which will soon cut it, is on a level 500 feet below the old tunnel on the Commercial side. It is said the ledge is approximately 200 feet wide, the main pay streak next to the foot wall being 3 to 5 feet wide.

Herald: Plans for the 300-ton pyritic smelter for the Bingham C. & G. M. Co. have been approved, and W. H. Nutting, the designer and constructing engineer, is on his way back from Boston and New York. On his arrival contracts for building will be closed.

Bulletin: Seventy men were discharged at the United States mines this week.

SUMMIT COUNTY.

Review: A new system of ore delivery is at the Ontario and Daly-West mines, at Park City, the long tunnel at the former property being utilized. This tunnel was extended from the Ontario through the Daly into Daly-West ground, and ore from the Ontario and Daly-West is run out a short distance to railroad transportation. A train of twelve cars is drawn by one mule, the intention being to deliver 180 tons of ore at the mouth of the tunnel.

TOOELE COUNTY.

(Special Correspondence).—The Eutonia, thirty miles northwest of Tintic district, is a lead-silver proposition of good promise. The last car of ore hauled from it is said to have run 42% lead, twelve ounces silver and small values gold. It is being opened through an inclined tunnel. The ore is principally galena, but in places it is carbonate.

The Bingham West Dip Tunnel Co. is to be incorporated, its purpose being to drive a tunnel from a point in Pole canyon, on the west side of the Oquirrh range, in a southeasterly direction, cutting under various properties on the Bingham side of the mountain. As projected, the tunnel will be four miles in length, and on a level 2100 feet below the crest of the range. It will cut the formation almost at right angles and will tap the Old Jordan and Galena grounds considerably below their present workings and will be driven on a drainage grade toward Tooele valley, which lies several hundred feet below the mouth of the tunnel. Some twenty claims, owned by men concerned in the enterprise, and located on the west dip of the Oquirrhs, will be acquired by the new company. It is understood also that the promoters are securing the co-operation of various surface owners along the tunnel site as located.

WASCOTT.

Tooele, Feb. 20.

WASHINGTON.

FERRY COUNTY.

The nineteen tanks at the Mountain Lion, Republic camp, contain 90,000 pounds of steel and over 6000 pounds of rivets.

WYOMING.

CARBON COUNTY.

The Newsboy Co. have been putting up buildings for the past month and are now sinking. The ore is mostly bornite and copper glance.

It is reported a smelter for Grand Encampment will be built next summer.

FOREIGN.

AUSTRALIA.

The increase in the gold production of New South Wales for '99, which doubles the output for '98, has no corresponding increase in mining activity, nor in rate of extraction per ton. It is concluded that greater care has governed the compiling of returns, and in the past there has been a failure in this respect. In the Tasmanian total, gold exported in blister copper amounted to 25,000 ounces.

BRITISH COLUMBIA.

Mgr. E. B. Kirby of the War Eagle and Center Star ascribes the shutting down of those mines to inability of equipment to supply ore to smelter and push development simultaneously.

The Commonwealth group, West Kootenay, has been bought by the Canadian Gold Fields Syndicate for $50,000. Mgr. J. C. Drewry says a compressor plant and 150-ton concentrator will be built.

The miners' unions of Sandon, Silverton and New Denver will accept the owners' compromise offer recognizing $3.25 as the standard wages for an eight-hour day instead of $3.50 as heretofore; the strike is off.

KOREA.

By the steamer Coptic last week came from Korea 1840 sacks concentrates to the Selby Smelting Works, San Francisco, from the Sloat Syndicate's mines, the second shipment of the kind.

RUSSIA.

Platinum occurs in the Urals, in the Government of Perm, where it is found on various private properties and State lands. In the mining district of Goroblagadat there are about seventy allotments under platinum exploitation by different private proprietors. Platinum occurs in the form of alluvial deposits, or platinum-bearing sands, which frequently contain gold. These deposits vary in richness from several doli to four or five zolotniks and more in 100 poods of sand. (One zolotnic=96 doli, or 4.2657 grams, or 65.830 grains troy. The Russian pood is equal to 36 pounds English). The thickness of the platinum-bearing deposits is rarely less than 3 and often reaches 7 feet. The grains of platinum are small, but nuggets are frequently found weighing one or more kilograms. As in California the platinum is often accompanied by iridium and osmium. The Ural platinum deposits are the only ones in the world, so far as is at present known; it is worked nowhere else in place and is known only as a mineral finely dissemintated in certain rocks. All the platinum extracted in the Urals is forwarded in the crude state to St. Petersburg, whence it is sent abroad. Although there are two laboratories in the Russian capital for refining platinum ore, the greater part of it is exported in the crude state. The production of platinum is subject to a tax of 3% for leasehold and 4% for freehold works. The yearly profits thus accruing to the Government average from 60,000 to 80,000 roubles. The rapid and variable fluctuations in a price of a product having no definitely fixed exchange value, but which is indispensable to the arts, are reflected upon the production of platinum in Russia. Thus, when the price of the metal is high it is profitable to work the poorer deposits, while it is only possible to work the very richest when the price is low.

The first deposit of platinum in Russia was discovered in 1819, the actual exploitation of this metal commenced in 1824.

From 1828 to 1845 platinum money was coined in Russia. The denominations of these coins were three, six, and twelve roubles. The total value of the platinum money put into circulation was 4,250,000 roubles. During that period the production of platinum increased considerably, but when the coinage was stopped the exploitation of the metal almost entirely ceased, and only revived in 1859. From that time the production has varied with the foreign demand and market price. The production of platinum began 1824 with 2 poods and 1 pound, and in 1825 it had increased to 11 poods, 24 pounds. From 1886 to 1890, the last period for which there are published data, the product was 1033 poods, 6 pounds. The total production of crude platinum from 1824 to 1890 was 6373 poods, or 3,670,968 ounces. A portion of the platinum now produced is obtained as a by-product of gold. In 1890 there were eighty-two platinum deposits under operation, and the total washing of 47,334,100 poods (about 763,453 tons) of sand yielded 173 poods, 26¾ pounds (about 147,980 ounces).

The largest quantity is now extracted from the deposits of Nizhni-Tagilsk, belonging to Prince Demidoff-San Donato, and at the Krestovozdvighensk deposits Count Schouvaloff. There are now about 7000 men actually employed in the exploitation of platinum. Among all foreign countries Great Britain is by fair the largest consumer of Russian platinum, taking on an average about 200 poods yearly. The value of the annual exports of platinum amounts to from 1,200,000 to 1,600,000 roubles.

THE KLONDIKE.

Thawing machines supersede the first slow method of handling the frozen ground, and gravel that goes $2.50 to the cubic yard is now worked at a profit. A "modern" plant on the Yukon comprises boilers, pumps and engines. The material is hoisted from a shaft, and water warmed by steam from the boiler exhaust is used for sluicing.

Commercial Paragraphs.

THE Pelatan-Clerici plant of the Cochiti G. M. Co. will be in charge of E. Walser of Denver, Colo., who is now in Bland, N. M.

F. R. FIELD, Colorado representative Jeffrey Mfg. Co., has returned from Fairfax, Wash., where he installed a power plant of the Northern Electrical Mfg. Co.'s electrical machinery and mining machinery.

THE Sullivan Machinery Co. of Chicago report sales of seven drills and equipment to the Iron Silver M. Co., Leadville, Colo., four drills to the Ajax mine, Victor, Colo., and five drills and equipment to the Kanawha lease, Creede, Colo.

THE Mine & Smelter Supply Co. of Denver, Colo., has shipped twenty Wilfley concentrators to the Anaconda Copper M. Co., Anaconda, Mont., and three 15-ton chlorination barrels, with equipment, for the National Gold Extraction Co., Florence, Colo.

THE John A. Roebling's Sons Co., Trenton, N. J., have completed a large order for the United States Government, amounting to 2200 miles of galvanized Norway iron wire, Nos. 9 and 14 gauge, and weighing 440,000 pounds. This order was entered, started, inspected and shipped inside of ten days, every coil being accepted on rigid examination by the United States inspectors. The shipment was directed to the chief signal officer at Manila and went on the Java, Feb. 5.

Recently Declared Mining Dividends.

Raven G. M. Co., Cripple Creek, Colo., $10,000; payable March 20.

Daly-West, Park City, Utah, $75,000; Feb. 17.

Grand Gulch, Utah, $2400; Feb. 17.

Gold Coin M. & L. Co., Victor, Colo., $20,000; payable Feb. 25.

Consolidated G. M. Co., Victor, Colo., $10,000; payable Feb. 25.

Personal.

T. F. VAN WAGENEN is now at 1508 Fillmore St., Denver, Colo.

W. C. PARSONS of the McCabe mine, Arizona, is in San Francisco.

J. R. PHILLIPS is Supt. Amador Queen No. 2, Jackson, Amador county, Cal.

F. B. JOYCE, Supt. Defender mine, Amador county, Cal., is in San Francisco.

W. J. BATEMAN succeeds N. W. Clayton as Gen. Mgr. Salt Lake & Los Angeles Co.

CAREY W. THOMPSON, Supt. Victor, Jr., G. M. Co., Placer, Or., is in San Francisco.

SUPT. LOGAN of the Old Home mine, Grass Valley, Cal., is in San Francisco on business.

G. B. UNDERHILL, Mgr. Arizona Onyx Co., Mayers, Ariz., has gone to Glasgow, Scotland.

H. A. COHEN is in Shasta county, Cal., arranging for a smelter for the Bully Hill property.

J. TILTON of the Cleveland mine, Grass Valley, Cal., is in San Francisco buying machinery.

JNO. A. KIRBY, former Supt. Bullion-Beck, Utah, goes to the Daly-West, Park City, Utah.

G. W. PORTER, formerly of Cripple Creek, but now of Old Mexico, is visiting Cripple Creek, Colo.

R. R. BOWLES of the Pyritic smelter of Leadville is visiting mine owners at Cripple Creek, Colo.

G. D. WAUGH has been appointed Supt. for the Portland, Clinton and Buxton Co.'s, Deadwood, S. D.

C. W. STICKNEY of Montana has taken charge of the Arizona, Eastern & Montana Smelter, near Mayers, Ariz.

JOHN TEMPLE is succeeded in the superintendency of the Fanny Rawlins mine, at Leadville, Colo., by Mr. Robinson.

W. S. WARD has gone to Paris, where he will have charge of the mining exhibit of the United States at the Exposition.

FRANK A. LEACH, Supt. U. S. Mint, San Francisco, is at Forest Hill divide, Placer Co., Cal., where he has mining interests.

W. C. RALSTON, Pres. California State Miners' Association, left San Francisco for Washington, D. C., on the 22nd inst., to be absent thirty days.

THE visit of J. S. MacArthur to Australia is in the interest of the North Mt. Lyell Co. and to inspect the resources of the west coast of Tasmania.

JOHN HARNAN of the Portland G. M. Co. of Colorado Springs, Colo., has been appointed Gen. Mgr. Colorado & Deadwood M. Co., Deadwood, S. D.

W. C. WYNKOOP, former publisher of the Mining Industry and Review, Denver, Colo., is manager of a mine at Woodbury, N. M., in the Cochiti mining district.

T. H. SIMMONDS has resigned the superintendency of the Empire M. & I. Co., Nevada county, Cal. G. W. Starr has assumed personal management thereof.

P. W. CAMPBELL, Mgr. Gold Crown M. Co. at Newsome, Idaho, and J. A. Hutchinson, Mgr. Trade Dollar, Idaho, have been looking over the mining districts of eastern Oregon.

JOHN F. MCDONNELL, Sec. Virginia City, Nevada, Miners' Union, has been appointed by Governor Sadler a delegate to the International Mining Congress, at Milwaukee next June.

MESSRS. BECKER, BAYHA, DOBBLESTEIN, FORSTNER AND STAHLER of San Francisco are at Sutter Creek, Amador county, Cal., examining the Baliol mine and other properties.

D. G. JEWETT, late Supt. Big Bug Smelting Works, Mayer, Ariz., is now consulting metallurgist for the Boston G. M. & M. Co. and the Venture G. M. & M. Co., Guffey, Park county, Colo.

EDGAR RICKARD left San Francisco on the 21st for Launceston, Tasmania, in the interests of the Venture Corporation, which recently bought the Briseis tin mine for $750,000 cash and the same amount in shares of the new company.

S. C. HIGGINS, Sutter Creek, Amador county, Cal., has returned from Punjom, State of Pahang, in the Malay peninsula. He went out there eighteen months ago in the interest of the Punjom M. Co., whose head office is in Hongkong. He was Supt. of the milling and fitting departments, having been engaged by one of the owners of the mine in San Francisco previous to his departure. He considers the conditions for American mining men favorable in the Malay peninsula. The Government is liberal in its concessions. Returning on the same steamer with Mr. Higgins were two Americans who had gone to the Orient for oil exploration—one in Burmah, the other in Sumatra.

Industrial Notes.

—Ballard, Wash., shingle mills cut in 1899, 411,800,000 pieces.

—Lead ores are being shipped from Guaymas, Mexico, to Germany as blallast.

—The Los Angeles, Cal., Industrial, Mining and Citrus Exposition has begun.

—Dawson reports a strike of coal at Rock Creek, twenty miles from Dawson, up the Klondike.

—The United States is sending builders' hardware to the amount of about $45,000 a month to Mexico.

—The Colorado Fuel & Iron Co. has capital stock $25,000,000, issued and paid $15,000,090, debts $7,260,536.49.

—At Monterey, Mexico, an American syndicate, capital $10,000,000, will construct a steel plant to employ 4000 men.

—At San Francisco last week from the Orient by the steamer Coptic was brought 23,821 pounds of opium; value, with duty paid, $400,000; duty, $142,926.

—In Madison county, Montana, a dam is being constructed in the Madison canyon to secure water power for an electric light and power plant, to be 1000 H. P. and to cost $400,000.

—The Northern Pacific Railway will in March do away with gas as an illuminant and introduce a new system of electric lighting, each car being independently supplied with lighting power from motors on the car axles.

—The Maryland Steel Co. has closed a contract for 5000 tons of steel rails to go to Norway. This is said to be the first shipment to that country from the United States, and is believed to be the entering wedge of a large business.

—According to the specifications of the New York Rapid Transit Commissioners, $5,000,000 of electrical apparatus will be used in construction of the tunnel on basis of present prices. Before the road is in complete operation, expenditures for electrical apparatus will be from $12,000,000 to $13,000,000.

—James Detrick of California is arranging for the purchase of some ten-ton steel wagons and traction engines to draw them, with a view to establishing a freight line across the desert in the northern part of China, to enter active competition for the carrying trade, which is now done wholly by camel caravans.

—The third installment of $25,000 due on the $100,000 bonus to be loaned the Truckee, Cal., General Electric Co. for the construction of the plant at Floriston, Cal., has been paid by the Comstock mining companies. The last payment of $25,000 will not be due until after the plant is in operation and the power delivered on the Comstock lode.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR THE WEEK ENDING FEB. 13, 1900.

643,444.—PADDLE WHEEL—J. S. Allison, Portland, Or.

643,449.—RAIL ANCHOR—S. B. Anderson, Hartford, Wash.

643,263.—WHEELED SCRAPER—W. C. Bradford, Arbuckle, Cal.

643,245.—SLIDING DOOR LOCK—J. A. Eastman, Fruitvale, Cal.

643,373.—PARCEL REST—Gabriel & Atkinson, Portland, Or.

643,266.—DISPLAY HOLDER FOR HATS—Sarah E. Griggs, Woodland, Cal.

643,132.—BUGGY TOPS—C. R. Hesseltine, Creston, Wash.

643,269.—PLATE ICE MACHINE—J. C. Kitton, S. F.

643,249.—POTATO DIGGER—W. Kretzer, Baker City, Or.

643,271.—LOOM—J. H. Northrop, Tustin, Cal.

643,233.—GOLD WASHER—F. C. Pinnell, Lodge, Cal.

643,275.—PICTURE—A. N. Polymath, Los Angeles, Cal.

643,306.—CARBURETER—V. J. A. Rey, S. F.

643,608.—WAVE MOTOR—C. F. A. Roell, Los Angeles, Cal.

643,207.—BOILER—E. J. Sabin, Colusa, Cal.

643,543.—GARMLNT—Ella M. Schrader, Seattle, Wash.

643,552.—FRAMING JOINT—C. C. Squires, Seattle, Wash.

643,557.—WAVE MOTOR—S. P. Swearingen, Pasadena, Cal.

643,612.—DOOR CATCH—M. J. Thuestad, S. F.

642,213.—SHOEMAKER'S OUTFIT—H. Waters, Bisbee, Ariz.

642,438.—STOVE—J. E. & J. Wormald, Spokane, Wash.

643,182.—CAR COUPLING—O. Yates, The Dalles, Or.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PLATE ICE MACHINE.—J. C. Kitton, San Francisco, Cal., assignor of one-half to C. C. Hutchinson, Oakland, Cal. No. 643,269. Dated Feb. 13, 1900. This invention relates to an apparatus for cooling air which may afterwards be used under any condition where cooling or refrigerating is needed. It may be applied to refrigerating air in storage chambers of any character. It is particularly applicable to the freezing of ice upon the surfaces of large plates which are submerged in fresh water. The ice at first forms rapidly upon the surfaces of these plates when cooled from the interior by usual methods, but as the thickness of the ice increases, being a poor conductor, the rigidity of the formation decreases and it takes several days to form a thickness of ice as great as desired. The object of this application is to reduce the temperature of water between the gradually forming plates of ice so as to increase the rapidity of its formation by practically freezing from the outside as well as that adjacent to the freezing plate. The invention consists of a brine tank having a coil through which is circulated a refrigerating fluid, and in conjunction with this a rotary blower or air-forcing mechanism having a discharge pipe which enters the brine tank, and the air rising through the brine will be reduced to a very low temperature. By means of an air-conducting pipe connecting the upper portion of the brine tank with the lower portion of the water tank, and suitable distributing mechanism, the air thus refrigerated is passed through the water to be frozen, and, rising to the top, is again conducted to the air-forcing mechanism, by which it is returned to the brine tank and thus circulated.

DISPLAY HOLDER FOR HATS.—Sarah E. Griggs, Woodland, Cal. No. 643,266. Dated Feb. 13, 1900. The object of this invention is to provide a convenient removable attachment for any sort of base bracket, or other holder, made of sufficiently stout wires and providing the requisite elasticity with finger holes or loops, so that the arms can be pressed toward each other for the purpose of easily removing or replacing a hat without damage to the fragile structure.

WHEELED SCRAPER.—W. C. Bradford, Arbuckle, Cal. No. 643,263. Dated Feb. 13, 1900. This invention relates to improvements in scrapers which are mounted upon wheels, and comprise an excavating and transporting pan and carrier. It consists of a two-part pan, acting as a scraper, these parts being suspended from a framework which is mounted upon bearing wheels, and in conjunction with this are mechanisms by which the pan is lowered and tilted so that the cutting edge will engage the ground, and the device thereby be loaded; a means by which the pan is suspended above the ground when loaded so as to be transported to any desired point, and means for opening and separating the two parts to discharge the load at any desired point.

SLIDING DOOR LOCK.—J. A. Eastman, Fruitvale, Cal. No. 643,245. Dated Feb. 13, 1900. The object of this invention is to provide a lock which may be used for doors, sashes and other parts which are to be locked together. It is especially applicable to folding doors, the edges of which are brought together when the doors are closed, and which are separated by moving them apart. When such doors are large and heavy and settle or get out of line it is difficult to keep them in condition to be properly locked. In this invention the difficulty is overcome by providing for such movements of the locking bolt as will compensate for any settling of one part of the door or the other. This is effected by first projecting the locking bolt forward into the larger portion of the slot of the opposite door, then dropping it down until the head is engaged with the narrow portion of the slot and finally drawing it back against said slotted portion so that it will pull the doors close together in case they are inclined to separate. The opposite movement of the bolt serves to first clear it from the slotted plate, then raise it, then withdraw it through the wider portion of the slot and into the casing of its own door. By suitably arranged mechanism all these movements are effected by the turning of the key in one direction or the other.

Latest Market Reports.

SAN FRANCISCO, Feb. 22, 1900.

This is a legal holiday. Yesterday's quotations were as follows:

SILVER—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 59¾ cts. (1000 fine); San Francisco, 59¾: Mexican dollars, 47½c.

COPPER.—New York: Lake, 1 to 3 casks, 16.75 cash; carload lots, 16¼; Electrolytic, 1 to 3 casks, 16.50; carload lots, 16.00; Casting, 1 to 3 casks, 16.25; carload lots, 16.00. San Francisco: 17½@18. Mill copper plates, 21½c; bars, 23½@25c.

LEAD.—New York, $4.70; St. Louis, $4.70; San Francisco, $5.00; pipe 7½, sheet 8¾, bar 6½c. London, Soft Spanish Lead, £16 12s 6d=4.75c per lb.

SPELTER.—New York, $4.70; St. Louis, $4.70; San Francisco, ton lots, 6c; 100-lb lots, 6¾c.

ANTIMONY.—New York, 9½c; San Francisco, 1000-lb lots, 10c; 300 to 500 lbs., 11@14c; 100-lb lots, 15@18c.

BABBITT METAL.—San Francisco, No. 1, 10c.

IRON.—Pittsburg, American soft—pig—large lots—$25.25; Scotch, $26.50; San Francisco, bar, per lb., 3½c.

STEEL.—San Francisco, bar, 12c to 20c per lb.

QUICKSILVER.—New York, $51.75; London, £9 14s; San Francisco, local, $51.50 ℔ flask of 76½ lbs.; export, $47.50.

PLATINUM.—San Francisco, crude, $16 ℔ oz.; manufactured, $19@22.

FERRO-MANGANESE.—San Francisco, ℔ ton, $30.

ZINC.—San Francisco, 6c; slab, 6½c; bar, 8c.

ASSAY LITHARGE.—San Francisco, 10c ℔ lb.

TIN.—New York, pig, $32.50; San Francisco, $34.50; bar tin, ℔ lb, 40c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 40c to 50c.

NICKEL.—New York, 40@45c ℔ lb.

BISMUTH.—New York, ℔ lb., $1.80 50-lb lots; San Francisco, $2.50 to $3 lb lots.

CANDLES.—Granite 6s, 16 oz., 40s., 12c ℔ set; 14 oz., 40s., 11c.

FERRO-TUNGSTEN.—New York, 60c; San Francisco, 75c (60%).

MAGNESIUM.—New York, $3.50 ℔ lb.; San Francisco, $4.50.

TUNGSTEN.—New York, ℔ lb., 75c; San Francisco, 90c.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 34@36c ℔ lb.; carloads, 29@30c; in 10-lb. tins, 40c; sulphuric acid, 1¾c ℔ lb. 66% B; soda ash, $1.60 ℔ 100 lbs. 58%; hyposulphite of soda, 2¾@3c ℔ lb.; blue vitriol, 5½@6c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2½@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.00; sks, 95c ℔ 100 lbs.; chloride of lime, spot, $2.35@2.50; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, strictly pure, boiled, bbl., 68c; cs., 73c; raw, bbl., 66c; cs., 70c. Deodorized Stove Gasoline, bulk, 16c; do., cs., 22c; 86° Gasoline, bulk, 21c; do., cs., 27c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 15½c; do., in cs., 21½c; Lard Oil, Extra Winter Strained, bbl., 55c; cs., 60c; No. 1 bbl., 45c; cs., 50c; Neatsfoot Oil, coopers' bbls., 60c; extra bbls., 55c; cs., 65c; No. 1 bbl., 52½c; cs., 57½c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

Mines or prospects operated on contract to purchase, or under lease on fixed royalty or percentage, **Money** loaned mines, **Mining** companies organized, their property exported, financed and managed, **Mines**, prospects, mineral lands, mining securities, contracts, bonds, stocks, leases and options bought and sold or negotiated, **Examine** mines, prospects and mineral lands as to their value, method of working and condition of their titles. SITUATIONS WANTED.

BY ENGINEER, AS CHIEF IN MINE. Married, and will go anywhere. Efficient in steam, hydraulic, pneumatic and electrical power transmission. References. Address LOUIS B. GORDON, 1757 Howard Street, San Francisco, Cal.

Wanted.—Position as Assayer

For Gold and Silver Ores, or as Assistant Assayer. Eighteen months' practical experience. Address Box 78, West Berkeley, Cal.

WANTED.—By a Practical Miner and MINING BUSINESS Man, Position as Manager or Superintendent. Speak some Spanish. Would leave the United States if necessary. Good references. Address SUPERINTENDENT, this office.

Mining Engineer and Metallurgist, technically educated, with fifteen years of practical experience, is open for a new engagement as expert or superintendent. Specialty the treatment of rebellious silver and gold ores. Experienced in designing, building and running reduction works. Speaks and writes Spanish fluently. Address ALPHONSE BENO, P. O. Box 814, City of Mexico.

WANTED.

WANTED.—A Second-Hand White Howell Roaster, also a Revolving Drier.

Must be in good repair. Address ARTHUR HENDEY, Agent, Copper Chief Mining Company, Jerome, Arizona.

WANTED.

PARTY TO DEVELOP A COPPER PROSPECT,

ONLY FIVE MILES FROM RAILROAD.

138-foot shaft. Several tons of ore on the dump. High-grade rock. Address G. F. CLARK, Tempe, A. T., care of I. S. Watrous.

Quicksilver

For Sale in Lots to Suit.

REDINGTON & COMPANY, Wholesale Druggists, 23-25-27 Second Street, San Francisco.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from A. B. Jacks, in the Badger Hill Mine, near Spanish Ranch, Plumas Co., to deposit tailings in Whitlock Ravine; from Manuel Leal, in the Union Mine, in New York Township, Yuba Co., to deposit tailings on New York Flat; from Walter E. Peterson, in the Manila Placer Mine, near Igo, Shasta Co., to deposit tailings in a worked-out pit; and from the Cherokee Gravel and Gold Mining Company, in the Cherokee Gravel Mine, near Carter's, Tuolumne Co., to deposit tailings in Bear Creek, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on March 5, 1900, at 1:30 P. M.

Wealth Producers.

Copper mining has been more profitable than any other business undertaking.

STATISTICS SHOW THE GREAT RESULTS. WRITE FOR PAMPHLET.

COLONIAL COPPER COMPANY, 32 Broadway, N. Y.

WE BUY very rich Ores, Dental Scraps, Tellurium Ores, Mill Wastes, Jewelers' Sweeps, Gold Retorts, Old Iron Retorts, Base Amalgam, Quicksilver, Amalgamated Plates, Gold and Silver, Old Slags.

A. M. DONALDSON & CO.,

ASSAYERS AND WASTE PRODUCT SMELTERS,

1661 Larimer St., Denver, Colo.

Write for Donaldson's Assayers' Slag Hammer.

FOR SALE.—DEVELOPMENT INTEREST

IN A PROMISING UNDEVELOPED MINE. Good locality; splendid showing. For further particulars, address MINER, care of Editor Mining and Scientific Press.

Experienced Mining Engineer (age 40) reports on mines and their economical development; ore dressing; processes; mining machinery and mill construction. References. P. O. Box 971, Denver, Colorado.

DEWEY, STRONG & CO. SCIENTIFIC PRESS PATENTS PATENT AGENCY 330 MARKET ST. S.F.

UTAH and CALIFORNIA

Are two of the most magnetic names in the roll of States, and the best way to reach them is over the Rio Grande Western Railway. "Great Salt Lake Route." As the name intimates, the Rio Grande Western is the only line that passes directly through Salt Lake City on the way to California; and Salt Lake City and the Great Salt Lake are the two points which should certainly not be missed on your western trip, as they contain more interest to the average American than any two other points within the confines of the United States. Study the matter carefully and you will choose the Rio Grande Western for this reason as well as for the magnificent scenery, superb equipment and fast time. It is the popular route during the winter as in summer. Write to GEO. W. HEINTZ, General Passenger Agent, Salt Lake City, for particulars.

FOR SALE.

10 H. P. Gasoline Hoist for Sale.

Complete outfit in good condition. Price low. Address PAUL J. PITNER, Placerville, Cal.

FOR SALE.—DIVIDEND-PAYING, HYDRAULIC placer. Extensive deposits. Old channel gravel, water, pressure, grade, dump, and gold. Rigid investigation invited. Thoroughly legitimate. Banking references. Owner. IDAHO, care of Mining and Scientific Press.

Mines for Sale.

A specialty made of developed properties in Mexico and the Southwest. Good mines and prospects are wanted. Bona fide correspondence of mine owners, capitalists and investors solicited.
H. E. RUNKLE, Mining Broker, El Paso, Texas

Group of Gold and Silver Mines for Sale.

For sale on very reasonable terms, or leasing proposals will be entertained, a group of gold and silver mines in the State of Durango, with excellent old records and some good modern machinery. For full particulars apply to MR. A. KEMPSON (Resident Agent), care of Mr. Stalcknecht, Durango, Mexico.

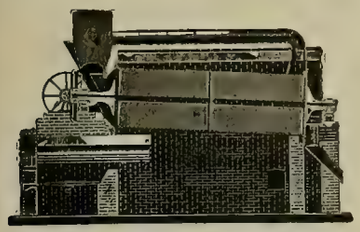
A BARGAIN.

3500 feet of 16-inch, 5 B. W. G. National Tube Works seamless pipe. Kimberly joints. Immediate delivery.

Address P I P I, Room No. 140, No. 32 Broadway, New York City.

STEEL RAILS FOR SALE.

400 Tons 40-lb Relaying T Rails with Plates.
One 30-Ton Saddle Tank Standard Gauge Locomotive, f. o. b. San Diego, Redondo, or San Pedro, Cal. Correspondence solicited.
C. J. TALLON,
308 Market Street, San Francisco, Cal



FOR SALE.
Relaying Rails
For Mines and Street Railways.
LEE CHAMBERLAIN & CO.,
155 North Main St.
LOS ANGELES.

HEALD'S

BUSINESS COLLEGE.

SMOOTH-ON CASTINGS.

An iron cement in powdered form, for repairing leaks or fractures in steam or hydraulic work applied by mixing with water; hardens quickly and expands in hardening. When hard it will with stand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

STEAM LOCOMOBILE FREIGHTING TRAIN.

CAPACITY OF WAGONS 16 TONS EACH, or total freight carrying capacity of train 50 tons.

CAPACITY OF ENGINE, 50 H. P.

THESE WAGONS ARE ESPECIALLY DESIGNED FOR STEAM FREIGHTING.

CAPACITY OF TRAIN, 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the world. Eighty of them in use on this Coast. They are being Successfully and Profitably Employed in Hauling Logs, Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend grades as much as 10% to 20%, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on a firm and moderately level road.

Send for descriptive Circulars and Price List of Engines and Wagons. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address

THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

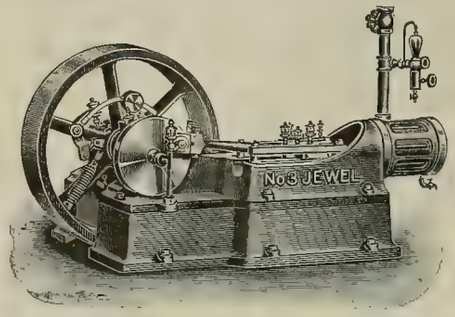
Wilfley Concentrators,
Machinery and Supplies of all kinds and for all Mining Purposes.

SPADONE'S CONCENTRATOR BELTS.

PATENTED.

This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.



Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and ½ inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

Send us your order for Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING, RUBBER PACKING and LEATHER BELTING.

OF EVERY DESCRIPTION.
All work tested and guaranteed.

IMPROVED PORTABLE HOISTING ENGINES

Sole Manufacturers of

Kendall's Patent Quartz Mills.

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are enabled to offer these mills at **Greatly Reduced Prices.** Having made and sold these mills for the past 16 years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap and durable mill that will do all that is claimed for it and give entire satisfaction.

Operator taking courses or horizontal angles with BRUNTON'S PAT. POCKET MINE TRANSIT.

If you wished to find the angle between two points below the horizontal with a sighting compass or an ordinary transit, you would first have to set up your tripod or staff and then level up your instrument. All this takes time.

If you only wanted to get the angle within a degree or so, you could take a BRUNTON TRANSIT, and, holding it in the position shown, take your readings in less time than you can place any other instrument. Send for descriptive catalogue B to

No. 044 BUTTON BALANCE. Sensibility 1-100 milligramme. If you are in the market for the very best balance obtainable at a moderate price, write us for particulars about the No. 044. You will be surprised to find how cheaply it can be purchased for cash. While we cannot recommend this balance for fine gold work, a great many assayers are using it for such successfully. Send for illustrated catalogue A, for complete description and prices, to

MANUFACTURERS OF

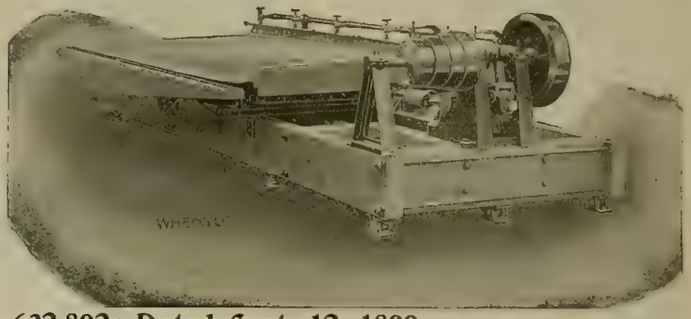
Smelting Furnaces and Equipments

For the Treatment of

Gold, Silver, Lead, Copper and Pyritic Ores.

THIS CLASS OF WORK IS A SPECIALTY WITH US.

We also manufacture all kinds of Ore Milling Equipments for Amalgamation, Concentration, Cyanide and Chlorination Processes.



(SEE PAGE 214.)

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

We have reports from mills employing Cammett concentrators for the treatment of ores containing galena, iron sulphide and zinc blende, that they are regularly producing on each table three distinct concentrates—one of galena, one of iron sulphide and one of zinc blende, each of which is commercially clean.

Practical experience with the Cammett concentrator proves that it **saves** and **delivers** into the **concentrates box** slimes so fine that to prevent them from being lost from the **concentrates box** it is necessary to provide several additional overflow tanks.

Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

ASSESSMENT NOTICES.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of January, 1900, an assessment (No. 22) of 3 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 27th day of February, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 19th day of March, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

CALIFORNIA BORAX COMPANY.—Location of principal place of business, San Francisco, California; location of works, San Bernardino County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 26th day of January, 1900, an assessment (No. 2) of Two ($2) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 310 Pine street, room 36, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of March, 1900, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of April, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. W. PEW, Secretary.

Office—No. 310 Pine street, room 36, San Francisco, California.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of February, 1900, an assessment (No. 15) of Ten ($10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 12th day of March, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 3rd day of April, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

SIERRA NEVADA SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of February, 1900, an assessment (No. 118) of 15 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 14, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on Tuesday, the 13th day of March, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of April, 1900, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. L. PARKER, Secretary.

Office—Room 14, Nevada block, No. 309 Montgomery street, San Francisco, California.

CENTRAL EUREKA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sutter Creek, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of February, 1900, an assessment (No. 14) of 3 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 9, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of March, 1900, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 9th day of April, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

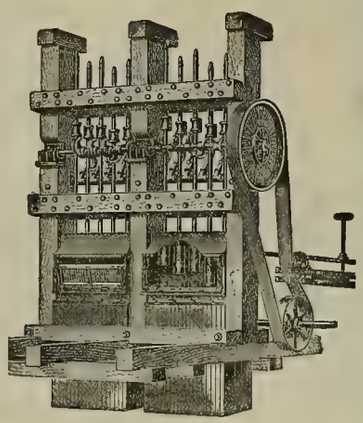
WM. A. M. VAN BOKKELEN, Secretary

Office—320 Sansome street, room 9, San Francisco, California.

STOCKHOLDERS' MEETING.

Notice of Stockholders' Meeting of the Union Hill Consolidated Mines.

In accordance with a resolution passed by the Board of Directors of the Union Hill Consolidated Mines, a meeting of the Stockholders of this Company will be held at 11 o'clock in the forenoon on Tuesday, the 27th day of February, 1900, at its principal office, 320 Sansome St., room 24, San Francisco, California, to consider and vote upon the proposition to increase the Capital Stock of this Company to four hundred thousand ($400,000) dollars in 400,000 shares at the par value of One Dollar each.



JOSEPH H. MOOSER, Secretary.

Dated San Francisco, January 16th, 1900.

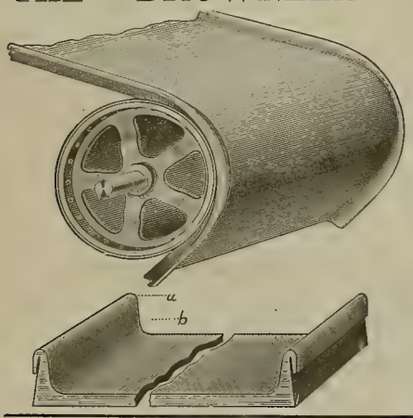
Why Detroit Lubricators Should Be Preferred.

In addition to their many other good qualities, the Detroit Lubricators are made extra strong and heavy, each one being tested at a pressure of 300 lbs. to the square inch before it is allowed to leave the factory. This is probably twice as high a pressure as they will ever have to work under, so they are very durable and longlived, and, unless injured by accident, will not require any repairs for years. For this reason, they are particularly well adapted to users in the Rocky Mountain district and on the Pacific Coast, where it is expensive and inconvenient to get repairs. Our catalogue showing our different styles of sight feed lubricators, glass and brass oilers, oil pumps, oiling devices, etc., will be sent on application.

DETROIT LUBRICATOR CO., DETROIT, MICH.

For Testing Placer Ground.



Sinks and drives 6, 8 or 10-inch pipe through boulders; takes all the loose material out, including gold, as the hole is sunk. Does the work at a very small cost. Drills water and oil wells and mineral test wells through any kind of rock to 1500 feet. Several sizes. Unexcelled for lead and zinc testing.

Something New in Engineering.

Editorial note was made in the issue of the 17th ult. of the new plan of the California Debris Commission for impounding debris in the Yuba, Cal., river, which involves something novel in engineering. The problem is a vast one, commensurate with the extent and novelty of the plan proposed for its solution by the United States engineers. The idea in general is to control the flow of water by a series of dams. This plan as conceived by the engineers in charge, endorsed in their report and approved by the chief of engineers, is to store and hold the mining debris in the Yuba river above the point where the work shall begin, to construct a series of large settling basins in which the water shall deposit the debris it carries down, and to regulate the flow of the stream through its low-water channel. A series of several barriers built across the bed of the river, and of subsequent dams, parallel levees and settling basins of considerable extent constitute the detail of this novel engineering project, which is the result of long-extended experiment and investigation. The project itself, in its entirety, is largely experimental, and attempts to deal with untoward conditions that exist on an unusually extensive scale, for in this instance it is not a question of controlling the water, but of checking the advance of millions of cubic yards of fine soil carried down from the Sierra foothills. The engineers in charge explicitly direct attention to the fact that the continuance of hydraulic mining is to them a secondary consideration, and that their sole present idea is to successfully store existing debris in that vicinity and improve the present condition of the Yuba river. They say that, after many years of consideration of all the problems presented, they have rejected all previous plans or projects, and believe that $800,000 public money could be judiciously expended in an effort to put the present plan in actual operation. There is at present available therefor a joint State and federal appropriation of $500,000.

Committee's Unanimous Report.

Reference was made in the issue of the 17th ult. to the bill introduced in Congress to create an executive department of mines and mining. Following is the report of the Committee of Mines and Mining unanimously recommending its passage:

The Committee on Mines and Mining, to whom was referred the bill (H. R. 5030) to create an executive department of mines and mining, to be known as the "Department of Mines and Mining," unanimously report the accompanying bill and recommend its favorable consideration and passage by the House of Representatives.

The bill consists of nine sections.

Section 1 provides for the creation of another department, to be known as the "Department of Mines and Mining," the design and duties of which shall be to acquire, by examination, practical and scientific experiments, geological research, or otherwise, useful information on the subject of mining in the comprehensive sense of the word, including mines and mining for gold, silver, platinum, lead, copper, iron, marble, tin, zinc, quicksilver, antimony, aluminum, manganese, nickel, coal, petroleum, natural gas, stone, clays, cement, emery, infusorial earths, phosphate rock, gypsum, salt, borax, bromine, sulphur, chrome iron ore, metallic paints, asphaltum, flint, and all other minerals and mineral water, as well as waters used in mining, manufacturing, or developing electric power, and to diffuse such information among the people of the United States.

Section 2 provides for a secretary of mines and mining, his appointment by the President, by and with the consent of the Senate, and makes certain sections of the Revised Statutes applicable to said department.

Section 3 provides for an assistant secretary and the mode of his appointment.

Section 4 provides that the secretary shall receive the same salary now paid to the secretary of each of the Executive Departments, and that the assistant shall be paid the same salary as is now paid the First Assistant Secretary of the Interior.

Section 5 prescribes the duties to be performed by the proposed department.

Section 6 provides that the Geological Survey shall be transferred to the department of mines and mining.

Section 7 declares that all officers and employes of the Government or any bureau or division engaged in duties referred to in section 5 of this bill shall be transferred to the proposed department.

Section 8 provides for the transfer of all records, maps, documents, surveys, machinery, now possessed or used by any existing Department, to the department of mines and mining; and

Section 9 provides that this Act shall go into effect on March 4, 1901.

The want of practical and scientific information on the subjects connected with mines and mining by the people of the United States is apparent. It is difficult, if not practically impossible, to get real data—the necessary practical facts upon the subject. The useful, necessary, and scientific facts, if known at all, are beyond the reach of the people. No country in the world is richer in its mineral resources than ours, and yet we probably have less information upon the subject accessible to the people than in any other leading nation in the world.

In most of the leading countries of the world there is either a council general, commissioner, secretary, or minister of mines and mining, with duties similar to those proposed by this bill. Almost all the great nations have more cabinet secretaries or ministers than we have. England has 17; Canada, a responsible government of the English nation, has 13. The German Empire has 12; Prussia, a responsible government of that Empire, has 10; so has France, Victoria, and New South Wales. Italy has 11. Honduras, Denmark, Hungary proper, Austria proper, and New Zealand each has 9, while Queensland, Colombia, Netherlands, Persia, Portugal, Roumania, Spain, Sweden and Norway, and Switzerland each has as many cabinet secretaries or ministers as has the United States. Measured by the other leading and commercial nations of the world, with the addition of another member of Cabinet to the official family of the President the United States can not be said to have too large a Cabinet.

In England this great industry of mines and mining is looked after in a distinctive branch of the "Department of sciences and art." France has a council general of mines. Germany has a minister of public works who has charge of mines. New South Wales, New Zealand, Queensland, Victoria and Persia each has a minister or secretary of mines.

The development of our own resources would do away with the necessity or fact of importation of mineral products, open new mines, enlarge others, and increase the demand for labor.

The asphaltum beds of the Uncompahgre Reservation in Utah, and elsewhere in the United Sates, are inexhaustible, and yet there is imported annually into this country from Cuba and Trinidad $300,000 worth of asphaltum. The development of this industry would keep this money at home and give employment to many people. The practical facts as to how to mine these fields and carry the product to market with profit to the mine owner and give reasonable wages to wage earner would be an item of much value.

Five hundred thousand dollars' worth of mineral waters are annually imported into this country from foreign nations which go to pay their owners and laborers, while the best and greatest variety of mineral waters in unlimited quantities are to be found in our own country going to waste, and our people remain idle for the want of employment. The practical information as to where they are and how to develop, bottle and market these waters are among the practical facts which are wanted. Bulletins or books of information upon this subject should be distributed among the people. The State of California has taken out of her mines $1,300,000,000 in gold since 1848, and yet that industry is said to be practically at its beginning. Information shows that there are mountains of refractory ore rich with gold which are not to be reduced by any known process. Hydraulic mining in that State has been enjoined and that kind of mining stopped, except in a limited way. The courts compelled these mines to close down because the debris therefrom by torrential waters were carried from the mine into the navigable streams in such quantities as to impair their navigability, and also to cover up the farms in the valleys below. This State turns out nearly $20,000,000 in gold annually, and if hydraulic mining could be again carried on it is estimated that this sum could be swelled to $30,000,000 annually. Practical information as to how to reduce these refractory ores and to carry on hydraulic mining without injury to navigable waters and the farms below by restraining dams, sluices, or in some other way would more than compensate the expense of the department of mines and mining proposed by this bill for a century to come.

While this report might be extended on these lines almost without limit, it is thought further illustrations which suggest themselves would serve no purpose here.

Notwithstanding the lack of information, this industry has made wonderful strides. The output of coal in 1849 was 4,000,000 tons, in 1896, 186,000,000 tons; iron, in 1850, 600,000 tons; in 1896, 9,000,000,000 tons; lead, in 1850, 18,000 tons; in 1896, 188,000 tons; gold, in 1848 was $5,000,000; in 1896, $60,000,000; mineral waters in 1880, $500,000; in 1895, $4,260,000; mineral paints, in 1880, $135,000; in 1896, $621,000; copper, in 1880, $11,500,000; in 1896, $50,000,000; petroleum, in 1880, $24,000,000; in 1896, $60,000,000.

Electricity and all other power generated by water may be and is properly defined to be the finished product of which water is the ore. It is therefore properly classified under the head of mines and mining.

The annual output of mines and mining is of great magnitude and runs into the billions of dollars. The output of mines alone, in the restricted use of that word, is over $1,000,000,000 annually, and employs about 1,000,000 wage earners.

Taking into consideration the transportation and handling the products of the mines, the number of people employed is more than twice as many as are engaged in turning out the ores from the mines.

The application of electricity and water in mining and manufacturing can not be overestimated. The study, development, and application of such power it is confidently claimed will make practicable and feasible the building up of new industries where none exist to-day, by reason of the present prohibitory cost of fuel.

This measure is not local, but extends to and covers the whole corporate limits of the Union. The people are practically unanimous for such a measure and there is no known opposition.

There is no leading country in the world which has given so little attention to this subject as has the United States.

It can not be expected that either of the heads of the departments, bureaus, or commissioners can do any more work than they now perform. It is a fact known to all who have business with the departments that each and all of them are overworked and overcrowded with work.

The department proposed by this bill is a necessity, and your committee earnestly urges the passage of the accompanying bill.

It has taken five years' continuous work to get the matter so far along; and, while it is in good shape, the friends of the measure must not assume that it will be immediately successful. There is no special opposition to the measure; every one to whose attention the matter is brought agrees that it is a present national necessity, but there exists in many quarters the chilly inertia of indifference that retards any movement, however worthy. The one thing needful now is for every one everywhere who takes an interest in the advancement of the industry to advocate by voice and pen the passage of the bill. The question is now merely one of votes in Congress (assuming that the Senate Committee concurs), and, if the attention of our national legislators is urged to its consideration, there is probably not a member of either house who would oppose it.

The only impending present possibility of failure would be the tendency of different regions to begin forwarding the claims of some favorite son of that section to receive the presidential appointment. That should not appear. The moment there were apparent effort to lobby or logroll for any individual in connection therewith, that moment active interest and co-operation ceases. Men will work for a principle and co-operate for a cause, but naturally and justly resent the injection of personality therein; time enough to consider the question of appointment after the measure has passed. The position will probably go to some one east of the Alleghanies. Since the known acquiescence of the U. S. Geological Survey in the bill, there is no real obstacle to its passage; and, while even stronger arguments for the passage of the bill than those adduced by the committee as above could be cited, yet the heartiness and unanimity of the committee presages favorable action by the national Legislature toward this necessary measure.

TO MINING ENGINEERS AND METALLURGISTS of good repute publicity is a necessity in a business point of view, for, no matter how well known a man may be, or how skillful and successful, he is apt to be forgotten unless he keeps himself before the public, because of likelihood on the part of the public to forget a man in the absence of any notice of him in the papers that are read by the men to whom he naturally looks for engagements. It is the experience of men in and out of the offices of a mining paper that no part of a mining engineer's time is spent with greater advantage to himself than when he is writing some of his practical experience for some publication read by the mining world. This is the age of advertising, and, no matter how skilled or prominent one may be in his specialty, competition is now so great that it becomes a necessity for him who would not fall behind to keep his name before the public.

FOLLOWING closely upon the development of a good mine or mines comes the parasite of the mining business. He is never a beginner, but waits until the energy or money of other men make a place for him to attach himself. He is the individual who sends out the smoothly worded prospectus, in which is an elaborate description of good mines, which constitutes the information concerning the investment offered. His effort is expended in telling what good things there are in the section where his proposition is, resting the merits of his offer upon those of other enterprises—a purely parasitical method. Were he forced to attempt business on the merits of his own scheme, he would, in the majority of cases, have little or no material for his prospectus.

Concentrates.

THE population of California in 1880 was 804,836; in 1890, 1,208,130; in 1900, probably 1,800,000.

ZINC, lead, magnesium and antimony have white rusts, not soluble in water. Gold and platinum never rust.

THE pressure per square foot at the foot of a standpipe filled with water, 105 feet high, is 6562.5 pounds.

A MINOR born in the United States can locate and hold a mining claim, but during legal infancy can not directly transmit title.

ONE POUND of liquid ammonia, evaporated under pressure of twenty-five pounds per square inch, will occupy about 9 cubic feet.

A BELL weighing 500 pounds would be 29 inches diameter, 22 inches in height, would take a frame 42x46 inches, and a wheel 43 inches diameter.

IF a fan making fifty revolutions per minute passes 18,000 cubic feet of air, a fan making eighty revolutions per minute should pass 28,800 cubic feet.

IF 10,000 cubic feet of air per minute pass through an airway 7x8 inches, 5109 cubic feet per minute will pass through an airway 5x5 inches, length of airway and power being the same in both cases.

THERE is scarcely a mining camp in Colorado that has not some hot or mineral spring. There are hundreds of mineral springs in California, but in lower altitude and not generally associated with metal mines.

TO DEVELOP 100 H. P. (theoretically) under a head of 56 feet would take 120 gallons water per second. A flume 1500 feet long, with 6 feet slope, would need to be 10.7 inches square to discharge the required amount.

A WURTS non-arcing lightning arrester, such as furnished by the Westinghouse Electric & Manufacturing Co., would work satisfactorily for alternating or direct current circuit from 1000 to 15,000 circuit voltage.

IN leaching works where silver is extracted from the ore by sodium hyposulphite and precipitated as sulphide the best method for refining the sulphide is to cupel it with lead, fine silver bars being the resultant product.

IN California stamp mill practise it is not uncommon to run 1000-pound stamps continuously at 120 drops per minute. Mill men argue economy of power in high battery speed, the cam engaging the tappet on the rebound of the stamp.

IN notices of forfeiture to joint owners for non-payment of necessary annual assessment work upon unpatented mining claims the notice must be published for ninety days, and the party so notified has ninety days after the last publication to pay up.

IN Colorado any one milling, sampling, concentrating, reducing, shipping or purchasing ore is by law required to keep and preserve a book in which is entered required data as to each lot of ore, when received or delivered. There is no similar law in California.

SULPHIDE ORES require to be crushed fine, both for sampling and subsequent treatment. "Cracking" the ore does not suffice where the percentage of sulphides is above 3. In smelting, ores containing 15% or more of sulphur should be previously roasted. There is no preparatory roasting in pyritic smelting.

UNSURVEYED mineral land is open to prospecting or purchase by citizens of the United States, or those who have made declaration in accordance with Sec. 2319 U. S. Statutes. An affidavit as to citizenship may be taken before the register and receiver of any U. S. land office, or any other officer authorized to administer such oath.

THE compendium of the annual report of the United Verde Copper Co., on page 237, shows that an average of 13.3 cents per pound was received for the mine's output for the year. The report of the Quincy, Mich., Mining Co. last week showed that a net average price of 17.1 cents per pound was received for its last year's product.

THE factor of safety of a hoisting rope should not exceed one-tenth of the breaking strain. If the breaking strain be 100 tons, the maximum safety load should not exceed 10 tons. Breaking strain reduces as the age of the rope increases; sudden jerks develop inert force and multiply the strain on the rope; starts with a slack rope cause excessive strain.

PYRITIC smelting is not yet viewed by all metallurgists as a perfect or wholly satisfactory process, and from a commercial standpoint the subject is one of continued discussion. An inquiry directed to the superintendent of the smelter at Oakdale, Georgia, W. H. Nutting, Bingham, Utah, or Supt. pyritic smelter, Leadville, Colo., might elicit some data.

QUOTING an analysis only, or giving solely the results of an analysis, gives no idea of the value of a bituminous coal beyond its sulphur, moisture and ash. Two coals may read precisely alike in analysis and one be comparatively worthless. The evaporation of water is the measure of value of a steam coal—not a laboratory experiment, but a practical test in bulk.

THE cost of running a small gold dredger should not average over $200 per week—that is allowing $125 for wages, $50 for fuel, and $25 for repairs, etc. If the dredger handles 10,000 cubic yards per week that would be at a cost of 2 cents per cubic yard. If the material averaged 6 cents per cubic yard there should be an approximate profit of $400 per week on an investment of from $25,000 to $40,000. Eighteen cubic feet of gravel in place will weigh 2000 pounds. A cubic yard will weigh one and one-half short tons.

A CLASS $4\frac{4}{5}$ C electric locomotive on a 2% grade exerts 1800 pounds draw-bar pull; if the car friction is decided to be 35 pounds per ton, the train resistance per ton will be that due to grade, 2x20, plus friction 35, equals 75 pounds per ton: then draw-bar pull, 1800, divided by 75, equals 24 tons train (cars and lading) hauled up the limiting grade.

EVERY reputable mining and trade journal rejoices and aids in awakening or creating the California oil development, and is equally agreed in frowning upon injury to such legitimate development by formation of companies designed to work the credulous or lure the unwary, for upon the actual success of initial operations hangs largely the fullest measure of future success.

IN the Fresno, Cal., water power pressure, at full flow at a head of 1411 feet, a sudden stoppage in the water flow will raise the hand on the pressure gauge to 1000 pounds per square inch. A stream of water from one of the deflecting nozzles will quickly bore a hole through a 3-inch plank; it will tear a hole through a $\frac{3}{8}$-inch steel plate in a few days; concrete would melt before it like sugar.

THE specific heat of a substance is its thermal capacity compared with that of water—that is, it is the ratio of the quantity of heat required to raise the temperature of a given weight of the substance 1° to the quantity of heat which will raise the temperature of an equal weight of water 1°. Latent heat does not exhibit itself by any rise of temperature and cannot be detected by the thermometer.

THE rotary converter as used for electrolytic work is simply a commutating machine. When supplied with alternating current at proper frequency and voltage it delivers direct or continuous current at the required potential. By its use it is possible to secure the advantages of the alternating current for transmission from the source of power and then to transform the electric energy into direct current.

IT is the duty of every mine manager and mine surveyor to have a complete and accurate map of the mine. One that is not complete and correct, or at least correct as far as it goes, is worse than no map at all. It should especially show all inside workings accurately, and nothing underground should be left to hearsay, remembrance or belief. And a map that was good five years ago or one year ago may be of no present value.

A STANDARD H. P. rating for boilers—thirty pounds water evaporated per hour from feed water at 212° F.: total pounds steam required per hour divided by thirty equals boiler H. P. necessary; approximate consumption of steam per indicated H. P. per hour is for plain slide valve engine thirty-five to forty pounds, high speed automatic engine thirty-two to thirty-six pounds, simple Corliss engine twenty-eight to thirty-two pounds.

A MUFFLE FURNACE is a closed reverberatory, constructed so that the products of combustion from the fuel are not allowed to mingle with gases evolved. It may be one long, continuous muffle, or consist of several muffles built one above the other in furnace construction. Such a furnace is chiefly used for roasting iron pyrites and zinc blende with intent to collect the sulphurous acid fumes free from fuel gases and excessive air, for use in making sulphuric acid.

A "LEVEL" may mean the whole system of workings on an approximately horizontal plane, but is also understood as the main working following or near and parallel with the lode. It may thus correspond to a drift; but is more permanent, since it is a main passage and haulage way, and is kept open until the ground above and tributary to it has all been worked out, or explored so far as indications or means warrant. If there is only one drift on a horizontal plane, there is no confusion of terms.

THE power factor of an induction motor is found by dividing the real H. P. applied to the motor by the apparent applied H. P. The energy supplied to a direct current motor is found by multiplying the current by the voltage, but in the case of an alternating induction motor this product, designated the apparent energy, is greater than the real energy on account of the fact that the current in such motors lags behind the E. M. F., and hence the useful effect is less than would be the case if the current and E. M. F. were coincident in phase.

"BLACK DAMP" is another name for the carbonic acid gas mentioned by A. Thurston Heydon in the article, "That Deadly Gas," in the issue of Feb. 24th. Its composition is two atoms of oxygen combined with one atom of carbon. One thousand cubic feet of it at 32° F., barometer 30 inches, weigh 128.45 pounds. It has neither color nor smell, but an acid taste. It is found in large quantities in the gases occluded by some coals; is also produced in mines by respiration, the burning of lamps, etc. It extinguishes a lighted candle and 8% to 10% of it in air is fatal.

AN air receiver forms an important part of an air compressing plant. It should be placed at a distance not greater than 50 feet from the compressor, and serves a useful purpose by receiving the air in pulsations from the compressor, and delivering it to the service being performed in an even, steady flow. The air as it comes from the compressor also contains more or less moisture, which collects in the receiver and may be drawn off by means of drain cocks. If the heat which is lost from the air during compression is restored just prior to its consumption, a gain in efficiency of 30% to 35% will be realized, and in addition freezing of the air in the exhaust passages of the machines being operated will be prevented. Reheating the air is necessary to the attainment of the best results.

THERE is no power derived or generated by the motion of balance wheels. They only transmit power that is imparted to them when augmenting their motion. Their usual office is to equalize speed by their momentum, through which they transfer the force received at the maximum to the minimum sections of the crank revolution. When a balance wheel is running free, it gives out power while in motion. Its weight in pounds multiplied by its rim velocity in feet per minute is its momentum in foot pounds, and this product divided by 33,000 is its H. P. for any moment.

GOLD in granite is a common California "formation." Around West Point, Calaveras Co.; near Perris, Riverside Co.; in Mono Co., and in northern counties may be found examples. The granite is usually syenitic. Such mines are not phenomenally rich. Probably the richest gold mining yields in California—other than hydraulic mining—mines producing large quantities from narrow veins—have been those found at contact of slate and diabase. That gold is found in limestone in California is well authenticated. The Blackhawk mine, San Bernardino Co., furnishes an example.

ALL workings following the ore channel or the flat may be termed "drifts;" but, besides the many gangways, or "levels," there are lesser prospecting drifts and extensions from stope floors. These, being of a temporary character, are cut with the smallest cross-section compatible with convenience, and timber is spared in them as much as possible. They are usually self-draining, leading the water into the main galleries, whence it flows to the surface, to sump or to pump stations. The floors being mostly uneven, the grade may be about 1:50. Drifts of this character usually follow the ore or the best ore, so that the cost of drifting may be repaid by the ore from the heading as it advances, or the work be done at actual profit.

ANY substance may be a gas or a vapor, according to its temperature. Substances which assume the gaseous condition at ordinary temperatures are termed gases; those which assume the condition of a liquid at the ordinary temperatures of the air are termed vapors when in the gaseous state. This distinction, however, is not scientifically accurate. The critical temperature affords a criterion for such scientific distinction. According to the latter standard, a gaseous substance at a temperature lower than the critical temperature is a vapor, a gas is a substance at a temperature higher than its critical temperature. So that any substance may be a gas or a vapor according to its temperature. Carbon dioxide, for instance, is a gas above 31° C., and a vapor at lower temperatures.

LAVAS are made up of eight chemical elements—oxygen, silicon, aluminum, magnesium, calcium, iron, sodium and potassium. Oxygen is in the larger proportion; so that lavas are mostly oxides. Next is silicon and alumina, giving the quartz, feldspar and silicate element. There are two kinds of lavas—acidic and basic; the former contain 80% silica, the latter 45%; the former are rich in potash and soda, the latter in lime and iron; the former are usually light in color and weight, the latter dark and heavy. Basalt is a good example of a basic lava; rhyolite is an example of an acidic lava. Andesites and phonolites are intermediate. The minerals composing these latter lavas are mostly quartz and feldspar, with the dark minerals mica, augite, hornblende, olivine and magnetite.

TO DETERMINE whether a given low-grade gold or silver ore can be profitably concentrated, take a weighed quantity of dry pulverized ore passed through a 40-mesh screen, such as will be an average sample of the bulk of ore treated, say one pound, after having previously assayed the sample. Pan this quantity carefully into a second pan, and re-pan until all the sulphurets are separated from the gangue, then dry and weigh the sulphurets and assay them; the weight represents the percentage of sulphurets the ore contains. A sulphuret in the old nomenclature was a compound of sulphur with a radical or element. In the latest nomenclature it has been superseded by the term sulphide, but is used to designate certain native undecomposed metallic sulphides, as gold-bearing pyrites. A sulphate is a salt of sulphuric acid.

The principle on which a jig works is the tendency of a mixture of ore particles of approximately similar size, but varying specific gravity, to arrange itself into layers according to gravity when given a motion of adjustment by a pulsating column of water. The ordinary type of jig consists of a water tank divided by a partition above, which does not reach the bottom. On one side of this partition is a horizontal screen on which the sized ore is fed, on the other side a loosely working plunger operated vertically by a crank or other reciprocating device. This plunger causes a regular pulsation of water through the screen, so affecting the particles of ore resting thereon that the heavier particles settle down through the lighter and either discharge through the screen itself or by an appropriate gate above the screen level, the lighter particles of rock moving on horizontally and discharging over the side or end of screen frame. Jigs have usually long wooden tanks with pointed bottoms divided longitudinally by a partition, and also laterally into two or more screen spaces discharging one upon another, and with equal corresponding plunger compartments on the opposite side of the longitudinal partition.

The California Copper Co.

The inception of smelting at Madera, Madera Co., Cal., at the California Copper Co.'s works, is of sufficient interest and importance to justify notice of the plant and the process employed. The mines of this company are at Daulton.

So much has appeared in recent numbers regarding California copper deposits, that little of general information can be published without repetition. Particular attention has not been given to the copper belt in Madera county. The belt that passes through that county is considered the same that extends from Amador on the north to Los Angeles on the south. Though ill defined in many places, it is comparatively uniform and can be traced by croppings some miles apart.

Copper was first mined in Madera county during the '60s, and spasmodic operations have been in progress ever since. In the immediate vicinity of Madera the most prominent mines are the Green Mountain, Ne Plus Ultra and Copper King, all of which are now being developed. The belt on which these properties lie varies considerably in width, but the mineral-bearing portion is confined to a comparatively narrow limit.

The vein, or mineral-bearing zone, is composed of shaly andalusite slates, interbedded with several hornblende minerals, in various states of decomposition, and copper ores, likewise in original and altered conditions. Originally, the copper ore was a mixture of chalcopyrite and pyrite carrying a small amount of gold and silver. As the result of weathering oxidation, leaching and redeposition, there has been formed a capping composed largely of oxide of iron. Below this is found a zone of carbonate of copper of varying thickness. Farther down are found the oxides mixed with sulphides of copper, and, still deeper, the unaltered sulphides. The depth to which oxidation has extended is uncertain, as there are no shafts in the country that have reached a greater depth than oxidized ores have been found. At one shaft in this vicinity complete oxidation has taken place to a depth of 85 feet, and scarcely a trace of copper remains in the decomposed sulphides, while at still another shaft, less than one-half a mile away, the original sulphides are found within 50 feet of the surface.

Local conditions vary so much that it is impossible to predict the depth of oxidation. The ore lies in the seams of the slates, sometimes only in narrow stringers, but quite persistent along their course. These stringers frequently develop gradually into shoots of ore 16 or 20 feet wide. What depth these shoots may have is unknown.

The recent activity in copper mining has caused capital to invest in that section of California; within the last year considerable money has been spent in prospecting, development and equipment. The Ne Plus Ultra mine, now being operated by the California Copper Co., located on the Raymond branch of the Southern Pacific Railroad, thirteen miles from Madera, is now shipping ore to its smelter at Madera. The smelting plant is between the main lines of the Southern Pacific and Santa Fe Railroads. At present a spur runs from the main line of the Southern Pacific to the smelter site, a distance of about a mile. Entering the company's grounds, the cars are run over a sixty-ton railroad scale. The spur then divides into three sub-spurs, of which two are run up at a 5% grade to elevated tracks for the unloading of ores, coke and limestone. The third track is on the general level of the smelter site and is used for the handling of fuel and supplies and the removal of matte from the furnace yards.

The plant consists of several buildings. The boilers, blower, engine, pumps and electric light plant are under one roof; standing next to this, the blacksmith shop, and just beyond this the furnace house, in which is erected a 100-ton, steel water jacket, stack furnace, built by the Union Iron Works of San Francisco.

The land on which the smelter is located is flat, so that to arrange for a slag dump the furnace floor is raised above the general elevation by 8 feet. The fumes and smoke from the furnace are carried through a brick dust chamber about 100 feet long to a wrought iron stack 5 feet in diameter and 75 feet high. The base of the stack is 25 feet high, making the total height 100 feet.

The ore from the cars is unloaded directly either into gravity ore bins or into bedding bins. Near the ore track is a sampling mill containing breaker and rolls, and adjoining this are the bucking and engine rooms. In the office building are located the general office of the company, the laboratory and assay rooms.

Water is supplied from three artesian wells, the depth varying from 50 to 200 feet, any one of which is capable of supplying 200 gallons of water per minute. The water is pumped to a 40,000-gallon tank, 40 feet above the ground. The plant is equipped for fire protection and is lighted by electricity.

This is a matte-producing plant, and later there will be added converters for the production of the metal. At present the product will be shipped East. F. F. Sharpless is general manager of the company, H. B. Nichols is superintendent of the smelter and William Davidson superintendent of the mine. Prac-

tically, all Western copper is reduced from matte obtained in the treatment of sulphide ores, and the process is of commercial importance. For a general understanding of the subject, commercial copper matte may be regarded as a mixture of subsulphide of copper with monosulphide of iron, the composition being varied by the entrance of other metals when they occur in the ores. This matte is produced by smelting together calculated quantities of oxidized and sulphide ores of copper and iron, limestone and silica. When oxidized ores are not available from the mines, the sulphide ores are partially oxidized by roasting—sufficient for the reaction in the furnace.

Occasionally an ore will approximate in its composition that of the charge in a furnace, when it is termed "self-fluxing."

The process of matte making is also of utility in concentrating gold and silver, which may be, and generally is, associated with the ores under treatment. These are subsequently recovered in the electrolytic process of refining the copper. Previous to this operation the matte has undergone "bessemerizing," an application of the Bessemer steel process to copper production.

The first converters in the United States for the treatment of copper mattes were erected for the Parrot Silver & Copper Co. at Butte, Mont. In them the matte is "blown" to metallic copper, the sulphur, iron, etc., being oxidized and slagged off. The tendency of modern practise is to make low-grade mattes—45% to 50% copper—for bessemerizing.

California State Mining Bureau Museum.

"Have you in San Francisco any exhibit or large collections of minerals, ores, etc., from which I can get an intelligent idea of California's mining resources?" is the substance of a question so often asked this paper personally and by letter, that an illustrated description of the museum of the California State Mining Bureau is in order. It has been a prominent part of San Francisco's show places for nearly twenty years; but this is an age of advertising, and the existence of anything however deserving that is not given widespread public notice is overlooked.

At the solicitation of this paper, Mr. H. S. Durden, the curator of the museum and long-time custodian thereof, has prepared the following:

In the Act of the Legislature creating the Bureau and defining the scope of its operations and the duties of the State Mineralogist, in effect in April, 1880, it was provided that the said official should "collect and preserve for study and reference specimens of all the geological and mineralogical substances found in this State, especially those possessing economic or commercial value;" also, those from all other States and countries which he could procure, which collections should be at all reasonable hours open to public inspection and study.

The Bureau obtained temporary quarters at 313 Pine St., San Francisco, and issued a circular, widely distributed, setting forth the objects of the institution and soliciting contributions of specimens.

The first and largest donation came from the California State Geological Society, which turned over their entire collection of 1327 specimens as a nucleus for the new museum.

There were also several boxes of specimens which had been exhibited at the Paris Exposition of 1878, and subsequently returned to San Francisco, which also came into the possession of the Bureau.

From this modest beginning the museum has steadily grown to its present size, largely by donations from individuals, and also by exchanges with other similar institutions, and by specimens collected by the attaches and employes of the Bureau.

A few minerals, not obtainable in any other way, have been purchased from time to time, when the funds of the Bureau permitted.

From 313 Pine St. the Bureau moved to 212 Sutter St. in June, 1881, where it remained until December, 1885, when it was removed to the Pioneer Building, on Fourth St., San Francisco.

In this building the museum occupied the entire top floor—a much larger space than had ever before been occupied by it. A number of new showcases were purchased and installed, which were rapidly filled up with specimens, chiefly from our own State. After the lapse of three years a gallery was built around part of the room, which afforded space for thirty cases, besides shelving on the walls.

As the collections continued to increase, room was made by taking out exhibits not strictly in line with the purposes of the Bureau, such as birds, animals and curios generally, and substituting therefor rocks, ores and minerals, and this process of substitution was continued until the end of 1898, when preparations were made to remove the Bureau to its present quarters, which was accomplished in January, 1899.

The museum now occupies the northern portion of what is known as the mezzanine floor of the Union Depot & Ferry House, at the foot of Market St., San Francisco, over the postoffice (Station D), access thereto being through the "grand nave."

The room is about 225 feet in length and 28 feet wide, in addition to which a number of miscellaneous exhibits are placed in the hallways and corridors adjoining.

The main room is occupied by two double rows and two single rows of showcases, extending the entire length of the room, part of the single rows on each side of the room being upright cases 8 feet high, with shelves for the large and heavy specimens which could not be put in the flat cases, or for special exhibits of rocks and marbles. (See illustration on front page).

The westerly double row of cases and some additional ones on the end and at the side are taken up by the ores of California, arranged as follows: First, gold quartz by counties, alphabetically arranged, beginning with Alpine and Amador and ending with Ventura and Yuba, and where there are large and important districts their ores are grouped together. For instance, the quartz from Angels Camp and vicinity, from Grass Valley and Nevada City, will be found together, and not scattered through the entire county exhibit. The gold quartz occupies the first thirty-two cases, then follow five cases silver ores, three cases copper ores, four cases quicksilver ores, and six cases of chrome, manganese, antimony, iron, zinc and lead ores, all arranged by counties, alphabetically. The upright cases on this side contain the large specimens of gold quartz, silver, copper, iron ores, etc., following the same general arrangement, the last three being devoted to samples of building stones found in this State.

In the window spaces are flat cases with ores from Africa, Alaska, Arizona, Colorado and other States and countries.

The easterly double row of cases contain the "mineral collections," i. e., choice and typical specimens of the various minerals, largely from California, but including specimens from all over the world. These are arranged in groups according to their mineral character, without any reference to the locality where found. Each group is arranged on the same system. For instance, the iron minerals begin with the native metal, then the various oxides, the silicates, sulphides, arsenates, sulphates, phosphates, chromates and carbonates in the order named. Passing on to the copper group, it will be found arranged on the same system, and so on through the list. Thus anyone, once aware of this method, can readily find the mineral he is searching for, especially as a chart of the cases is hung in front of a window just inside the entrance to the museum room. This division occupies thirty-four cases, the remainder of the row being used for the economic minerals, as clays, sulphur, soda, borax, salt, etc., and coals, lignites and hydrocarbons generally, principally from the Pacific coast. The side cases in the window spaces are occupied by specimens of California marbles, fossils illustrating the geology of the State, largely from the petroleum regions, ores from Mexico, Australasia, Canada, etc., tin ores and sundries. The upright cases between the windows are occupied principally by type specimens of California rocks, except two, which contain polished marbles from Eastern States and foreign countries.

At the southerly end of the cases containing gold quartz from California is a special case in which are displayed a number of choice specimens of gold in quartz, placer gold, platinum, tellurides of gold, diamonds, sapphires, etc.; and opposite is a case used for the temporary storage of new specimens as they are received. The method of arrangement of the various divisions of the museum is the result of experience gained by many years of attention to the inquiries of visitors, and is designed to accommodate the largest number, for while some people would like to see all the products of their county bunched together it is a fact that a much larger number come to examine a certain class of ores or economic minerals; hence it is better that each metal or mineral should be grouped together in one or more cases, instead of being scattered through fifty-seven groups, as would be the case if all ores and minerals from any one county were placed together.

Besides the classified collections already mentioned there are a number of special exhibits, such as models of mines and mine timbering, appliances used in mining, ethnological and historical relics, Indian stone implements, arrow points and curios generally.

On the walls are views of mines and mining operations, views of petroleum districts, maps, etc. One unique set of views, taken in 1852, showing early methods of placer mining, is especially worthy of mention, and in contrast is a set of views of modern hydraulic mining on a large scale.

But the reader may ask, "What is the use of this collection?" Its uses are various. The merchant or manufacturer visits it to ascertain where the material he wants is found, and at the same time he sees a sample from which he is able to judge if the material from any given locality is suitable for his purpose.

The miner or prospector comes to learn the appearance or physical characteristics of ores and minerals he is not familiar with, to educate his eye and acquire information in regard thereto.

The student of mineralogy visits it for similar reasons, and many of them spend days in succession examining the specimens and making notes for future use.

The capitalist and intending investor visits it to examine the ores of the county or district in which he contemplates operating, and instances are not wanting where the good showing made by some district or locality has induced the investment of capital to open up new mines or reopen old ones. Consequently it is to the interest of all sections of the State to contribute examples of their mineral products to the museum. And, lastly, it is one of the regular and permanent attractions the city offers to visitors, and it is by no means rare to hear people say that one of their principal reasons for coming to the city was to see this collection, or that they had stayed over another day for that express purpose. The museum is nominally open from 9 A. M. to 5 P. M., but many visitors arrive as early as 8 A. M. All are welcome, and any information in our power to give is cheerfully furnished; and the steady increase in the number of visitors shows that the museum is appreciated by those acquainted with it. H. S. DURDEN.

The Hunting Savage.

Under the title "The Evolution of Simple Societies," A. C. Haddon in the February issue of Knowledge says: "History is not concerned—or should not be—merely with the rise, progress, and downfall of dynasties and with the doings of great men, but it takes into cognizance the evolution of the people in general. The population of any country is not an incoherent mass, but is composed of groups, and it is the business of sociology to study the origin and history of these groups, which are subsequently welded into nations. Sociology is partly the study of the raw material of history as it endeavors to account for the idiosyncrasies of societies and groups of men whose ultimate fate is described by history." Describing the races accustomed to the chase, he continues: "Hunting is suited to the generality of men, for it is interesting, and it calls forth intelligence and the satisfaction of outwitting animals; it gratifies the lust of killing, and supplies an exciting element of chance, which keeps hope alive through disappointments The food is stimulating and enjoyable. No preparatory work or thought is required to provide the supply of food. These conditions appeal to the majority of mankind. * * * The hunting savage is naturally improvident. His true property consists in his skill and agility, which he can neither sell nor bequeath. The grave question of the transmission of property does not exist for him. No tie binds, even materially, the generations with one another to induce solidarity. Individualism triumphs. The family cannot retain its members at home; all the children successively separate as soon as they can provide for themselves. The family periodically dissolves, scattering to found new homes as instable as the preceding. Such are the characteristic traits of the instable family, which develop the spirit of change. * * * The chief of these small families forget the memory of their elders, and take no pains to transmit the remembrance of the great actions of the race to their descendants. Verbal history, so prolix in sedentary communities, is almost non-existent among nomadic hunters. Magical practises may be developed, but true religion—that is, the worship of a spirit or spirits—is in a very primitive stage. Among the South American hunters not only is there no respect for their progenitors, but they may abandon and even eat their parents. The instable family often leaves orphans, the sick, the aged—in other words, the feeble and incapable—without refuge and sustenance; there is no fixed home to act as a place of refuge."

Table Showing Capacity Lost by Air Compressors Operating at Various Altitudes Above Sea Level.

Altitude above sea level, ft.	Barometer, inches.	Efficiency of compressor, %.	Loss, %.
0	30	100	0.
500	29.42	98.4	1.6
1,000	28.85	96.9	3.1

Cutting Drill Steel.

TO THE EDITOR:—For the benefit of miners and readers of the MINING AND SCIENTIFIC PRESS, I give my way of cutting drill steel for drills, etc. I use an old stamp mill die to cut on. On the bottom of the die there is a depression about 1″x3″x⅛″ deep. It requires only two blows with a blacksmith's sledge and cold chisel with handle. Cut the first lick on the smooth face of the die, and the second over the depression and opposite the first cut, the steel lying lengthwise with the depression, and it will break and fly like glass. Any large piece of heavy iron could be thus prepared for the purpose.

Hornbrook, Cal.

Note on the Plate Amalgamation of Gold and Silver.*

By E. A. H. TAYS, San Jose de Gracia, Sinaloa, Mexico.

As I promised, in a former paper on the Bryan mill, to give further data regarding the plates from four battery aprons, I now submit the following:

These aprons were 4.5 feet wide by 16 feet long; the first two plates of each apron were 4.5x4.5 feet, and the remainder of varying sizes, as can be seen by their relative weights, as shown in the table; but all were 54 inches wide. They were in use four years and nine months, and about 15,265 tons of ore passed over each. The ore was quartz, carrying about the same weight in silver as in gold; showing some copper, and highly impregnated with ferric oxide. The tailings show about 0.6% and the bullion about 10% of copper. The silver was present mostly as sulphide; and the copper was also present as sulphide, with some carbonate.

The ore treated in 1898 was a fair average of the whole run; so I take it as an example from which to make a few deductions.

	Gold. Ozs.	Silver. Ozs.
The ore assayed, per ton	0.76	0.71
The tailings, per ton	0.22	0.44
Amount extracted, per ton	0.54	0.27
Extraction, per cent	71.1	39.4

From the above we see that the ratio by weight of gold to silver in the bullion produced, as per assays, should be 2 to 1.

The average fineness of the bullion produced during the same period was: Gold, 658.80; silver, 240.80; showing a ratio of 2.74 to 1.

From the annexed table it will be seen that the several ratios on the apron are:

Apron.	Gold.	Silver.
1	2.58	to 1
2	2.65	to 1
3	2.61	to 1
4	2.58	to 1

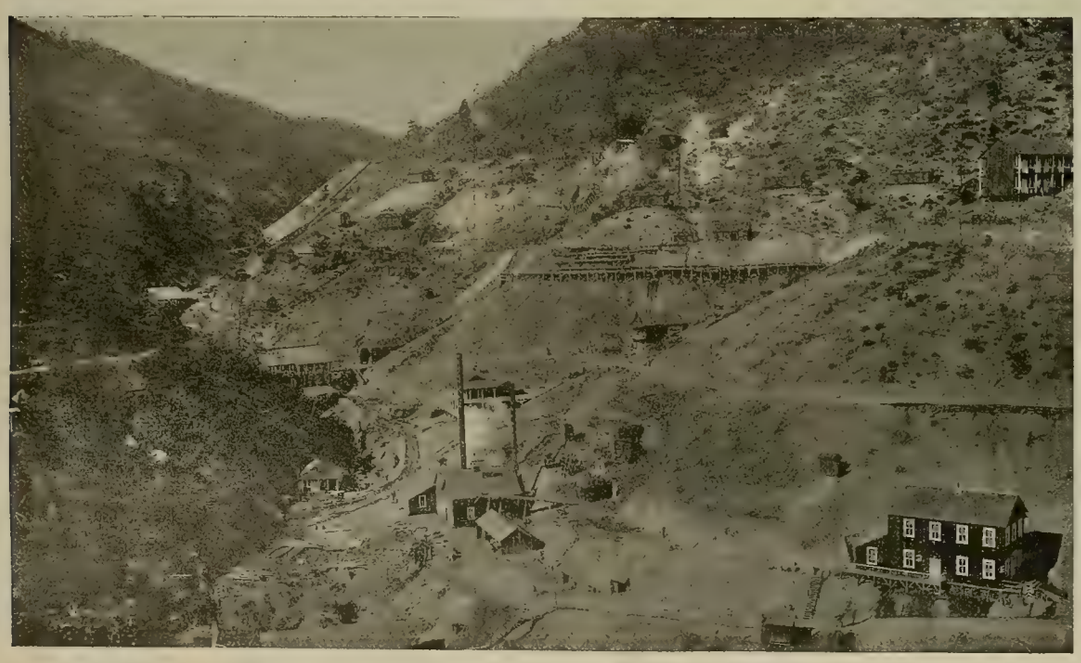
One apron, No. 4, shows a regular gradual decline in value from top to bottom; all the rest show varying values, though the top plate is always richer than those below it. Apron No. 1 is very irregular in the relative values of the successive plates.

All of these aprons would have given much more bullion; but in 1897 plates Nos. 1 and 2 of each apron were scraped very close with steel chisels, and at least $10,000 in gold was taken from each apron. But no special and exact record was made of the amount at the time.

In this case it is seen that, although the assays of the ore treated call for a ratio of 2 gold to 1 silver in the bullion, the actual ratio of the bullion produced was 2.74 to 1. The approximate average of the bullion recovered from the plates, when these were melted into bars, so as to make a fair average of the entire product, is 2.605 to 1; which shows but a slight variation from the bullion itself.

Over the Bryan mill plates, already referred to, there passed about 24,440 tons of ore; and the bullion obtained from these shows a ratio of 2.31 gold to 1 silver, which is somewhat nearer the assay ratio of 2 to 1.

From the above data we are led to infer that where all values contained in the plates are obtained together, all bullion, whatever its source, will have about the same ratio, and that the silver which is in it fit form for amalgamation is just as amenable to it as the gold, showing no greater—or but little greater—tendency to resist amalgamation at the top than at the bottom of an apron. It is probable, however, that much depends, in this regard, on the nature of the ore treated.



*Transactions of the American Institute of Mining Engineers, Washington meeting, February, 1900.

TABLE SHOWING VALUES OF MILL APRONS REMOVED AFTER A RUN OF FOUR YEARS AND NINE MONTHS.

Plate.	Weight, oz. troy.	FINENESS IN Gold.	FINENESS IN Silver.	OUNCES FINE Gold.	OUNCES FINE Silver.	Total value.
Apron No. I. 1	1341.7715	92.00	38.70	123.443	51.927	$2582 73

Cave at a California Copper Mine.

On the 1st inst. a caving in the copper level of the Iron Mountain mine, fourteen miles from Redding, Cal., entombed eight miners, five of whom were got out by the rescuing party that was immediately put to work. The accompanying engraving illustrates the scene of the accident—the Iron Mountain mine, owned by the Mountain Copper Co.—where (including the smelter at Keswick and kindred operations) nearly 1000 men are employed. Insecurity and inadequate timbering are cited by miners as the cause of the caving. In rescuing the five men they were got out by an improvised hoist through ore chutes to the rock drift above the copper level. All of the five men taken out died soon after and it is thought that the others are dead.

Iron Mountain Mine, Shasta County, Cal., the Scene of This Week's Disaster.

(Entrance to the level where the cave occurred is seen to the right, half way up the gulch.)

Another Arizona Compliment.

The MINING AND SCIENTIFIC PRESS is the foremost mining journal not only in America, but, as far as our own knowledge goes, in the world.—Kingman Miner, Feb. 24.

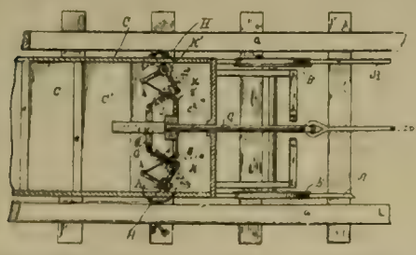
The Buried Alps.

It is now well recognized that the granitic core of a great mountain chain is not in itself the cause of the elevated highland, so says Prof. Cole in the current number of Knowledge. It has not forced itself up, splitting asunder the superincumbent strata, and hurling them back on either hand; but it bears in its own structure all the signs of stress and pressure, and has clearly been elevated with the strata, along some line of wrinkling in the crust. Here and there, remelting has gone on in the core, as the old rocks moved upward from Precambrian resting places; at other places fresh molten masses have intruded from some caldron far below. Along the axis of movement, the old crust has been squeezed together like a sponge; the liquids have escaped from one hollow to another, and at last consolidated as crystalline igneous rocks, destined to weather out in resisting peaks and pinnacles. The great arch, as it rose, became the natural receptacle for most of these flowing masses; hence when denudation worked against the chain, these reconstituted types of the fundamental rocks—ancient gneisses that had renewed their youth, began to stand out pre-eminently as a great central ridge. The stratified covering was swept from them, and is now found only in the foothills, where its very structure, consisting of folded layers, still renders it an easy prey. Rain and frost work in along the upturned bedding planes; and the strained masses are always ready to slip and settle down before the earth tremors that still attack the chain. The central core, then, marks out the axial character of the mountains, where, on the other hand, it has not been pushed sufficiently towards the surface; the features of the foothills may prevail from side to side of the wrinkled area. Thus it is that, as we approach the end of the chain, the scenery is less austere, and more broken up into local landscapes—not so generalized as in the grander altitudes of the range. This becomes markedly felt in the eastern borders of the Alps, where the hills ramify like huge fingers, grasping between them the inlets of the European plain. At times we scarcely realize the presence of the massif, the potential mountain range, though all the time it lies buried at no great depth beneath us. Describing the shelterless alluvian plains, the Professor says: Up in the Alps you may crouch beneath a rock and see the lightning leap from scar to scar, and hear the church bells ringing out their answer from the fields a thousand feet below; but here, in the great open, the elemental forces will hold you more securely in their grasp. A hand, as it were, at first gentle, then imperious, pushes you forward from behind. In the air there are resistless spirits; in the oak forest there are strange whisperings and the cry of frightened birds. The herd boy, with his rustic pipe, knows these things better than the wisest student of geography.

An Appreciated Compliment.

The MINING AND SCIENTIFIC PRESS, published at San Francisco, is to-day the leading mining journal of the world. Portions of its contents, whether editorial, by scientific writers, or pertaining to mines and their development, are copied throughout the United States by journals of various denominations. It is always replete with newsy paragraphs, bright editorials and reliable information to miner, mine owner, manufacturers of mining machinery and the capitalist in general.—Jerome, Arizona, Mining News, Feb. 19.

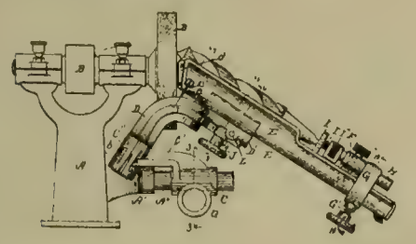
D. TOMMASI, an Italian inventor, has produced a cartridge for mining and blasting purposes inexplosive until its contents are electrolyzed by the passage of a current. The cartridge is a stout glass tube, contains a platinum wire sealed at each end, and is filled with a concentrated solution of ammonium chloride, which, when electrolyzed by the passage of a current through it, decomposes into chlorine, ammonia and hydrogen. The chlorine reacts upon the ammonia and decomposes it, forming hydrochloric acid and chloride of nitrogen. When the gases thus disengaged attain sufficient pressure, the tube bursts, the resulting shock detonating the chloride of nitrogen.



A NEW use for refrigerating machinery has been found in the contemplated cooling of magazines of warships so as to prevent explosion danger from overheating. Experiments with that end in view have been made for some time; but it is only recently, with plans proposed by Rear-Admiral O'Neil of the United States Navy, that any fair measure of success is said to have been attained. It does not seem unlikely that in vessels yet to be built magazine refrigerating apparatus will be one additional adjunct to the list of marine auxiliary machinery.—Cassier's.

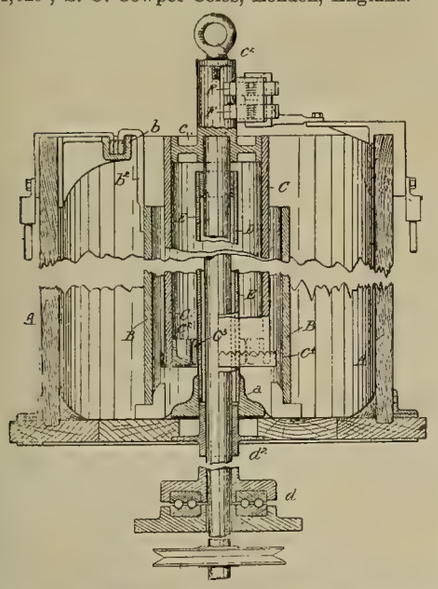
Latest Mining and Metallurgical Patents.

Patents Issued Feb. 20, 1900.



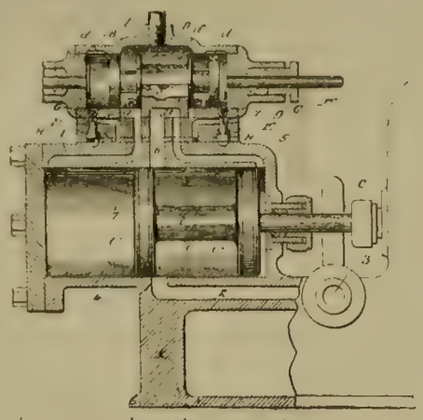
Spec'ally Reported for the MINING AND SCIENTIFIC PRESS.

MINE ELEVATING APPARATUS. — No. 643,674; J. Muirhead, Laurium, Mich.



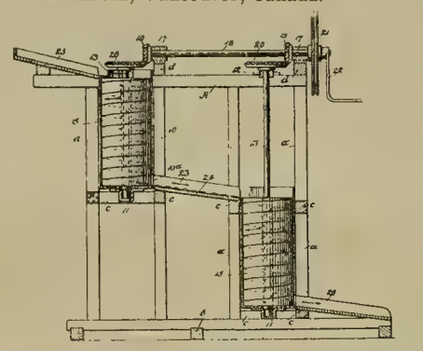
Combination with mine shaft; a car movable up and down shaft; draw-head carried by car and arranged longitudinally of the shaft; car-propelling cable operatively connected with draw-head; beam arranged longitudinally of the shaft, out of the way of the path of the car; a cam-shaped brake, having serrated face provided with several pointed teeth projecting beyond serrations, supported from car and arranged as required to render it capable of biting or clutching the beam upon oscillating it in one direction; two arms rigid with cam-shaped brake, and projecting laterally from axis of brake arranged at right angles to each other; a link operatively connecting one of the arms with draw-head; and a spring connected at one end to the other arm, and having its opposite end attached to the car.

DRILL GRINDING MACHINE.—No. 643,703; H. P. White, Kalamazoo, Mich.



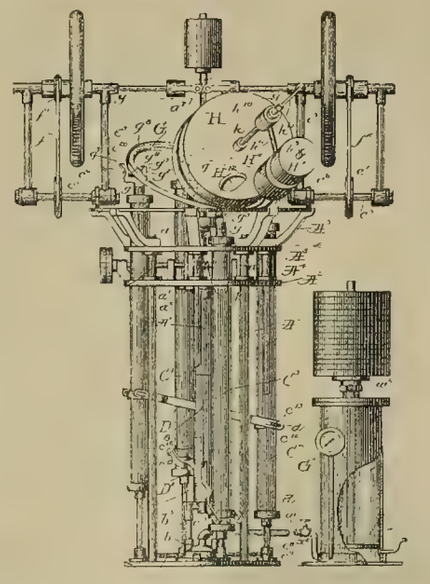
Combination of base A, carrying suitable grinding wheel B′; a cylindrical arm A″ extending parallel to axis of grinding wheel; a bracket C′ adjustably supported on arm A″; an arm D with a journal standing at an angle to the face of grinding wheel, extending into a journal-bearing box C″ back of face of grinding wheel and extending upwardly and then downwardly in front of grinding wheel; a V-shaped drill holder E rounded on its under side at E′ and resting on a curved bearing D′ on the arm D; a hand screw J extending upwardly through a transverse slot J″ in the bearing portion D′ and connecting by a screw thread with under side of drill holder to clamp same when adjusted in its support; an adjustable tail block or stock for drill holder and a drill lip rest secured to forward end of same.

PROCESS OF ELECTRODEPOSITION OF METALS.—No. 644,029; S. O. Cowper-Coles, London, England.



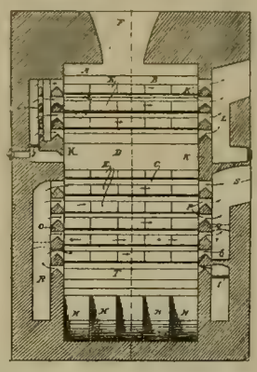
In electrodeposition of metals, process consisting in passing electric current from anode to cathode through electrolyte containing metal to be deposited, at such time moving cathode through electrolyte at such rate of speed as will cause hydrogen bubbles to be thrown off from cathode and give such friction between metal deposit on cathode and electrolyte as to yield tough and smooth deposits; rotating cathode at a speed approximating 1000 feet per minute.

STEAM PUMPING ENGINE. — No. 643,732; B. O. Rhodes, Harvey, Ill.



A steam pump in which the exhaust can be employed to heat the water, and in combination with a cylinder, steam chest, piston and steam actuated reversing valve, a ported deck plate arranged between the cylinder and steam chest and provided with steam actuated valve devices for controlling the admission and exhaust of steam to and from the reversing valve, each steam actuated valve device consisting of a check valve and an actuating plug for lifting such check valve.

AMALGAMATOR.—No. 644,009; C. G. Garrison and J. A. Fitzsimmons, Vancouver, Canada.



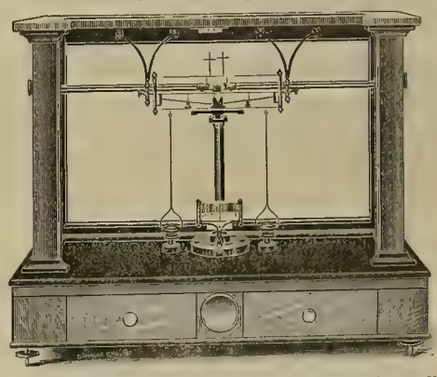
The combination with cylindrical casing 10, opening at top and having an outlet at bottom, of shaft projected vertically through casing; means for rotating shaft; series of spiral segments having amalgamating surfaces, detachably connected to shaft and rotative therewith, and adapted to be independently removed from shaft, each section having an upturned outer edge of depth of pitch of spiral formed thereby, whereby segments are disposed in successive engagement to constitute a continuous spiral chute or runway, outer edges of sections traveling contiguous to inner surface of casing, whereby water and auriferous material is held from contact with casing and caused to continuously flow through chute or runway and finally escape through outlet at bottom of casing.

AIR COMPRESSOR.—No. 643,918; K. O. B. Textorius, Boston, Mass.

A main frame comprising a base plate, upright standards, and a head carried by the latter, a receiving chamber on the base plate, a series of compressors radially arranged about chamber, each compressor including a cylinder and a valved piston therein, a fixed, hollow piston rod therefor communicating with receiving chamber, a vertically movable cylinder having an inlet valve, a rocking arm mounted on fixed pivot and connecting cylinders of opposite compressors, a series of bifurcated members connected to upper ends of cylinders, provided with supporting devices between branches thereof, a gyratory, annular track adapted to rest upon supporting devices, an actuator adapted to roll upon track, means to move actuator bodily in a substantially horizontal, circular path, whereby weight of actuator will operate to depress cylinders one after another, and means to retain upper portion of track in place.

QUICKSILVER FURNACE.—No. 643,839; H. C. Davey, Calistoga, Cal.

A quicksilver furnace with inner and outer walls, the former having passages or openings through them, superposed roasting and drying chambers between inner walls and connecting so that material will flow from one chamber to the other by gravitation, a fireplace and discharge flue for each chamber between inner and outer walls, with fireplace and discharge flue of one chamber separate and independent of fireplace and flue of other chamber, and means for supplying ore at top of one chamber and discharging it at bottom of other chamber.



A New Precision Balance.

The accompanying illustration is of a new precision balance with 5-inch beam recently placed upon the market by Wm. Ainsworth & Sons, balance makers of Denver, Colo., U. S. A.

The counterpoised sliding door has been removed to better illustrate the instrument.

This balance is of late approved construction, with "fall-away" pan rests and yokes having agate contacts throughout, there being no metal contact points with the beam or hangers.

A plate glass sub-base covers the entire base and all metal work is gold plated. The base is of mahogany, French polished, with two drawers in the base and counterpoised sliding door.

The beam, which is made of a new palladium alloy having a tensile strength of from 80,000 to 90,000 pounds, is divided into fifty parts—each side of the center for the use of a half milligramme or one milligramme rider—and there being no obstruction on the top, the rider may be placed at any point from the center to the last division on either end.

Cylindrical reading glasses are provided for reading the beam and index, and the latest improved rider apparatus with rod locks is furnished.

This balance has been designed for especially accurate weighings, such as "control" and "umpire" assays and for the most accurate work in scientific and chemical laboratories, balances of this general construction having been furnished sensitive to $\frac{1}{10000}$ milligramme.

THERE is for every substance some point of temperature above which it cannot become liquid; this is called the "critical temperature."

Masonry Dams and Retaining Walls.

NUMBER III.

Written for the MINING AND SCIENTIFIC PRESS by GEORGE T. PARDOE.

SECTION V.

Height of center of pressure $= \frac{28}{3} = 9.3$ feet.

Total water thrust $= 62.5 \times 15.5 \times 25 = 24218$ lbs.
Thickness at top $= 11.3$; thickness at bottom $= 14.3$ feet.
Weight of section V $= 10560$ lbs.; total weight $= 52840$.

Tangent of angle of resultant $= \frac{24218}{52840} = 0.458$.

Deviation of resultant from C. of G. $= 0.458 \times 9.3 = 4.2$.
Distance between centers of G. $= 6.2 - 5.1 = 1.1$ feet.

C. of G. from inner face $= \frac{1}{3}\left(11.3+14.3-\frac{11.3\times14.3}{11.3+14.3}\right) = 6.2$ feet.

C. C. of G. from inner face $= 6.2 - \left(\frac{42280}{52840} \times 1.1\right) = 5.3$ feet.
C. of Res. from inner face $= 5.3 + 4.2 = 9.5$ feet.

Outer limit middle third $= \frac{14.3}{6} + 7.1 = 9.4$ feet.

Inner limit middle third $= 7.1 - \frac{14.3}{6} = 4.7$ feet.

The line of resistance therefore falls slightly outside the limit. The figures show $\frac{1}{10}$ foot, but it is really less, the slight difference being caused by working to only one place of decimals.

The error, such as it is, can be readily corrected by adding a slice to the outer face, and being of proportionately trifling weight the horizontal position of the C. of G. will be practically unaltered.

SECTION VI.

Height of C. of pressure $= \frac{33}{3} = 11.0$ feet.

Total water thrust $= 62.5 \times 18 \times 30 = 33750$ lbs.
Thickness at top $= 14.9$; thickness at bottom $= 18$ feet.

NOTE.—$\frac{1}{10}$ foot added to top outer face to correct Section V.
Step added to inside face $= 0.5$ feet.
Weight of masonry section VI $= 13571$ lbs.
Total weight all sections $= 66411$ lbs.

Tangent of angle of resultant $= \frac{33750}{66411} = 0.508$.

Deviation of resultant from C. of G. $= 11 \times 0.508 = 5.5$ feet.

C. of G. from inner face $= \frac{1}{3}\left(14.9+18.0-\frac{14.9\times18.0}{14.9+18.0}\right) = 8.3$ feet (nearly).
Distance between centers of G. $= 8.3 - (0.5 + 5.3) = 2.5$ feet.

C. C. of G. from inner face $= 8.3 - \left(\frac{52840}{66411} \times 2.5\right) = 6.4$ feet.
C. of Res. from inner face $= 6.4 + 5.5 = 11.9$ feet.

Outer limit middle third $= 9 + \frac{18}{6} = 12$ feet.

Inner limit middle third $= 9 - \frac{18}{6} = 6$ feet.

NOTE.—It will be observed how the addition of the step inside reduces the outside batter, since it acts both by increasing the base and at the same time tends to bring the C. of G. of section VI nearer to the inner face.

SECTION VII.

Height of center of pressure $= \frac{38}{3} = 12.6$ feet.

Total water thrust $= 62.5 \times 20.5 \times 35 = 44843$ lbs.
Thickness at top $= 18$ feet; thickness at bottom $= 21.5$ feet.
Weight of masonry section VII $= 16293$ lbs.
Total weight of all sections $= 82704$ lbs.

Tangent of angle of resultant $= \frac{44843}{82704} = 0.542$.

Deviation of resultant from C. of G. $= 0.542 \times 12.6 = 6.8$ feet.

C. of G. from inner face $= \frac{1}{3}\left(18 + 21.5 - \frac{18 \times 21.5}{18 + 21.5}\right) = 9.9$ feet.
Distance between centers of G. $= 9.9 - 6.4 = 3.5$ feet.

C. C. of G. $= 9.3 - \left(\frac{66411}{82704} \times 3.5\right) = 7.1$ feet.

Distance of C. of Res. from inner face $= 7.1 + 6.8 = 13.9$ feet.

Outer limit of middle third $= \frac{21.5}{2} + \frac{21.5}{6} = 14.2$ feet.

Inner limit of middle third $= \frac{21.5}{2} - \frac{21.5}{6} = 7.2$ feet.

The line of resistance is therefore within the outer limit by 0.3 feet, and outside the inner limit by 0.1 foot.

SECTION VIII.

Height of C. of pressure $= \frac{43}{3} = 14.3$ feet.

Total water thrust $= 62.5 \times 23 \times 40 = 57500$ lbs.
Thickness at top $= 21.5$ feet; thickness at bottom $= 25$ feet.
Weight of masonry section VIII $= 19181$ lbs.
Total weight of all sections $= 101885$ lbs.

Tangent of angle of resultant $= \frac{57500}{101885} = 0.564$.

Deviation of resultant from C. of G. $= 0.564 \times 14.3 = 8.06$ feet.

C. of G. from inner face $= \frac{1}{3}\left(21.5 + 25 - \frac{21.5 \times 25}{21.5 + 25}\right) = 11.6$ feet.
Distance between centers of G. $= 11.6 - 7.1 = 4.5$ feet.

Distance of C. C. of G. $= 11.6 - \left(\frac{82704}{101885} \times 4.5\right) = 8$ feet.
Distance of C. of Res. $= 8 + 8 = 16$ feet.

Distance of outer limit of middle third $= 12.5 + \frac{25}{6} = 16.1$ feet.

Distance of inner limit of middle third $= 12.5 - \frac{25}{6} = 8.4$ feet.

SECTION IX.

Height of C. of pressure $= \frac{48}{3} = 16$ feet.

Total water thrust $= 62.5 \times 22.5 \times 45 = 71718$ lbs.
Thickness at top $= 25$ feet; thickness at bottom $= 29$ feet.

NOTE.—The outer face has a batter of 3.5 feet and the inner face a batter of 0.5 feet, as indicated by a preliminary calculation.

Weight of masonry section IX $= 22275$ lbs.
Weight of masonry, all sections $= 124160$ lbs.

Tangent of angle of resultant $= \frac{71718}{124160} = 0.577$.

Deviation of resultant from C. of G. $= 0.577 \times 16 = 9.2$ feet.

Distance of C. of G. from inner face $= \frac{1}{3}\left(25 + 29 - \frac{25 \times 29}{25 + 29}\right) = 13.5$ feet.
Distance between centers of G. $= 13.5 - 8.5 = 5$ feet.

C. C. of G. from inner face $= 13.5 - \left(\frac{101885}{124160} \times 5\right) = 9.4$ feet.
C. of Res. from inner face $9.4 + 9.2 = 18.6$ feet.

Outer limit of middle third $= 14.5 + \frac{29}{6} = 19.3$ feet.

Inner limit of middle third $= 14.5 - \frac{29}{6} = 9.7$ feet.

In the above calculation for the position of the C. of G. it has been assured as a preliminary that the inner face is vertical and that the batter of outer face is 4 feet. As, however, this would (as shown above) cause the inner C. of Res. to fall beyond the limit of the middle third and at the outside to fall 1 foot within it, we will alter the outer batter to 3.5 feet, as in section VIII, and add 0.5 feet, so gained, to the inner face as a wedge-shaped piece. This practically has no effect on the horizontal position of the C. of G., while it reduces the error on the inside to a very small amount, viz., 0.2 feet.

SECTION X.

Allowing the same batter to the outside and inside as in section IX, we have in section X:

Thickness at top $= 29$ feet; thickness at bottom $= 33$ feet.

Height of C. of pressure $= \frac{53}{3} = 17.6$ feet.

Total water thrust $= 62.5 \times 28 \times 50 = 87500$ lbs.
Weight of masonry section X $= 25575$ lbs.
Weight of masonry, all sections $= 149735$ lbs.

Tangent of angle of resultant $= \frac{87500}{149735} = 0.584$.

Deviation of resultant from C. of G. $= 0.584 \times 17.6 = 10.2$ feet.

Distance of C. of G. from inner face $= \frac{1}{3}\left(29 + 33 - \frac{29 \times 33}{29 + 33}\right) = 15.5$ feet.
Distance between centers of G. $= 15.5 - 9.4 + 0.5 = 5.6$ feet.

Distance of C. C. of G. from inner face $= 15.5 - \left(\frac{124160}{149735} \times 5.6\right) = 10.9$ feet.

Distance of C. of Res. from inner face $= 10.9 + 10.2 = 21.1$ feet.

Outer limit middle third $= 16.5 + \frac{33}{6} = 22$ feet.

Inner limit middle third $= 16.5 - \frac{33}{6} = 11$ feet.

We have again assumed a vertical inner face and an outside batter of 4 feet, and now correcting this we have an outside batter of 3.5 feet and an inside batter of 0.5 feet.

The slice added to the inside face evidently leaves an error of 0.2 feet, as in section IX, and a margin of safety on the outside of 1 foot.

The effect of the error on the inside is to cause tension on the outer face, but to a very small extent, and, as shown previously, the greatest danger is caused by a tension on the water face, the dangerous results of tension (and liability to fissuring) on which face has been already pointed out.

It is only fair, however, to remark that more than one dam is standing (and has done for many years) in which a considerable tension exists on the inner face when the dam is full.

For practical reasons concerning durability it is desirable that no tension should exist at all under any circumstances, and it will therefore be preferable to amend our calculated profile by adding small slices to inside and outside to correct the errors shown and at the same time to make the batters uniform or curved for the sake of appearance.

(TO BE CONTINUED.)

Chemistry of the Sun's Atmosphere.

Of all the heavenly bodies open to our inquiries, says A. Fowler in Knowledge, the sun is the one which can be best submitted to the processes of spectrum analysis; in the first place, because its light is so brilliant that instruments of great power can be utilized, and, in the second place, because it is near enough to admit of its component parts being separately observed. * * * Our terrestrial chemistry is but skin deep, and our solar chemistry is only that of the sun's atmosphere, for we as yet know nothing either of the interior of the earth or of the vast region which lies beneath the sun's photosphere. It must be borne in mind, also, that as regards the sun our knowledge is limited to the indications of the spectrum, which, in the case of a mixture of substances, may render no account of some of the elements present. Thus, although we are not yet in a position to assert that the composition of the sun is identical with that of the earth, it would not be easy to justify the view that there is any fundamental difference. * * * In the present state of our knowledge it does not seem possible to give a perfectly trustworthy list of the elements certainly present in the sun. One published by Rowland, in 1891, is the most extensive, but the more recently published tables do not seem to afford complete justification for it. Taking the tables, however, and including oxygen, gallium and the chromospheric and coronal gases, we may summarize the most probable elements as follows:

Aluminum	Hydrogen	Potassium
Asterium	Helium	Scandium
Barium	Iron	Silicon
Cadmium	Lanthanum	Silver
Calcium	Magnesium	Sodium
Carbon	Manganese	Strontium
Cerium	Molybdenum	Titanium
Cobalt	Neodymium	Vanadium
Copper	Nickel	Yttrium
Cronium	Oxygen	Zinc
Chromium	Palladium	Zirconium

In addition there is evidence which suggests the possible presence of the following elements:

Beryllium	Mercury	Ruthenium
Didymium	Niobium	Thallium
Erbium	Platinum	Tin
Indium	Rhodium	Tungsten
Lead		

Besides these, Rowland, in his 1891 list, includes germanium and glucinum among the elements present, and iridium, osmium, tantalum, thorium and uranium among those doubtfully present, while Lockyer concluded that lead and uranium were certainly present, and lithium, glucinum, rubidium, cæsium and bismuth probably present.

Cars Painted in Ten Minutes.

A number of American railways now paint all their cars by machinery, and the apparatus used is very curious and interesting. The paint is first mixed to about the consistency of cream and then poured into a small steel tank connected with a reservoir containing compressed air. When the valve is opened the stuff is forced up into a flexible tube about as big around as a man's thumb, and comes out of a brass nozzle in the form of a fan spray, thin as a knife blade. All the operator has to do is to wave the nozzle to and fro, using it exactly like a brush. The spray at the top is not more than an inch broad, so if he wants a narrow stroke he has merely to bring it near, and vice versa for a wide one. It is claimed that the apparatus deposits a paint film of exactly the same thickness throughout, which is, of course, impossible to do with a brush, and that its work is consequently more durable and a better protection from the weather. Be that as it may, there is no denying its superior speed. The rapidity with which painters using compressed air work is marvellous. They stand on movable platforms, which are pulled forward and back before the cars, and they literally paint them on the run. The time occupied for each averages about fifteen minutes, and the men claim that they can even do an entire car in ten at a pinch.—American Exporter.

MINING SUMMARY.

ALASKA.

Cape Nome sands are reported running $100 a ton, and sample $40.60 at the San Francisco mint.

The rush to Cape Nome has begun. Eight sailing vessels and several more steamers leave San Francisco next month. The demand for accommodations continues, and many thousands will doubtless go there this season.

The Government has decided to establish a winter overland United States mail route from the Cook inlet coast to Nome. To this end it is dispatching an expedition to travel over the Katmai trail and report on its practicability for mail-carrying purposes.

ARIZONA.

GRAHAM COUNTY.

The new concentrator of the D. C. Co. at the Yankee mine has made its first run. The large gas engines give satisfaction. It is the largest and most complete concentrator in that country. At the smelters the dust flue and smokestack have been connected and the sulphur fumes are carried over the hills.

MOJAVE COUNTY.

Miner: The strike in the Lucky Boy is all the talk in Chloride. The crosscut tapped 6 feet of ore that will average nearly $300 in gold and silver.

PIMA COUNTY.

At the Mammoth-Collins mine and mill and Aravapai plant Gen. Mgr. Blair has seventy stamps, which begin pounding next week. A 40 H. P. gasoline engine is in operation. The two cyaniding plants are operating on tailings, treating 500 tons daily.

YAVAPAI COUNTY.

(Special Correspondence).—The copper camp of Jerome is connected with the Santa Fe, Phœnix & Prescott Railway by a railway twenty-six miles long. Heretofore when written about, Jerome has been associated with the United Verde mine and its owner, Senator Clark of Montana, and nothing else. That the United Verde mine is one of the greatest copper deposits in the world goes without saying, and yet the air of mystery surrounding it is so great that writers have drawn upon their imaginations concerning its actual value and its output, both of which have been exaggerated. It is a close corporation and little data is furnished by its managers. What is true about it is that the company has for the past few years paid dividends at the rate of $3,000,000 per year. What has actually been earned is a problem which Prof. Treadwell, one of the minority stockholders, is now trying to solve in the New York courts.

Herewith is a summary of operations of the United Verde mine for the fiscal and calendar year of 1899:

RECEIPTS.

Sale of copper	$5,775,621
Silver	293,221
Gold	288,598
Anodes	16,719
Miscellaneous	21,708
Total	$6,395,868

EXPENDITURES.

Mine development	$ 555,147
Ore roasting	102,916
Converter expenses	1,036,191
General expenses	64,682
Freight	427,412
Depreciation	218,978
Bad debts	300
Mine prospecting	49,687
Miscellaneous	205,030
Total expenses	$2,660,346
Profit from operation	3,735,522
Total	$6,395,868
Mining profit for 1899	$3,735,522
Received from interest	89,999
Total	$3,825,521
Dividends	3,000,000
Balance	$ 825,521

Construction expenses in 1899 amounted to $801,110. The total product was 43,390,590 pounds.

The property was purchased by Senator Clark in 1888 and has been systematically developed ever since it came into his possession. The deepest shaft on the property is 700 feet. The longest tunnel is 3000 feet, which, at 1200 feet, strikes the ore body, which continues to the end, and which is reported to be 600 feet wide. Diamond drills, sunk from the bottom of the present workings, are said to have been in ore in nearly every instance. The reduction plant on the property, which is one of the most approved, has a capacity of 800 tons per day, but has never been run to its full capacity, owing to lack of water. At present the water is being used over and over again, and unless this district is soon blessed with rain or snow, the output of this property will be curtailed. The output at present is about eighty tons of metallic copper per day, better than 99% fine.

Jerome is a place of high wages and high prices for everything. The new boarding house or hotel, built by the United Verde Co., will soon be open. No transients will be entertained therein. When completed and fully furnished, $150,000 will have been expended. It is the finest miners' boarding-house in the world. It contains 200 sleeping rooms, most of which have two or three beds in them. All are carpeted and comfortably furnished. From 400 to 500 miners will be housed there in first-class shape. They will be charged $30 per month for board and $6 per month for a bed. It is four stories high, built of brick and stone. Besides the hotel, the company has constructed a fine hospital of brick and a large store.

The United Verde & Pacific Railway was built in 1895 and is a private corporation, owned by Senator Clark and some of his managers and officers. For the past year it has been running from nine to twelve trains per day, composed of eight cars to each train. The gauge is 3 feet and fifty-ton locomotives are used. After entering the mountains, there are eighty-three curves in twelve miles, running as high as 45°. The grade is 3%. There are but six-tenths of a mile of level track on the entire road. W. A. Clark is Pres., J. L. Giroux Vice-Pres. and Gen. Mgr., J. T. Wheaton Supt. and Gen. H. R. G. Minty Auditor and Gen. Pass. and Freight Agent.

The United Verde mine is not the only one in the district. The Jerome C. Co.'s property adjoining comprises 200 acres. The company was organized two years ago by Ralph Dillon, who is still Pres. and Mgr. The syndicate furnishing the money for the development of this property consists of Scotchmen of Dundee. When this company took hold of the property the greatest development was 300 feet. Active development began about a year ago, since which time $50,000 has been expended on the property. One tunnel is in over 1100 feet, gaining a vertical depth of 800 feet. Good ore has been developed. It is the intention of the company to erect a smelting plant. The company is capitalized at $4,000,000.

The Verde Queen C. M. Co.'s property, consisting of twenty-four claims, some of which lie almost within the town limits, lies under the hill below the town. Some of the claims owned by this company were located in 1896 and the remainder in 1899. Upon the Columbia they have opened a face 120 feet wide, from which one carload has been shipped to the El Paso smelter which gave returns of 26.7% copper. The company is capitalized at $1,000,000, and consists of New York and Ohio men, with Col. D. P. Bosworth at the head. A smelter, which has been purchased from Prof. James Douglas, will be brought here and put up within the next three months; it will be connected with the mines by a tramway, the steel for which is already on the ground. Forty men are employed.

Two miles east of Jerome lies the property of the Black Hills C. Co., Ltd., composed of Los Angeles capitalists, upon which fifteen men are at work. An incline of 160 feet has been run and a vertical shaft 90 feet deep has been sunk, both of which are well mineralized. Thos. H. Brown is the Supt. in charge.

The Jerome M. & S. Co.'s property is also situated in the Black Hills district, eight miles southeast of Jerome. Upon this property a shaft 35 feet deep has been sunk in ore running from 17% to 38% copper and ½ to ⅝ in gold per ton. A steam hoist has been ordered. The property is in charge of Doane Merrill.

Besides these properties there are others in the vicinity of Jerome upon which considerable money was expended during last summer; but work was discontinued during the recent flurry in copper stocks in Boston. It is said work is to be resumed on some of these properties in the near future.

A company has been organized which will afford peculiar facilities for the prospecting of mining claims in and about Jerome. It is the Jerome Electric Power Co., capitalized at $400,000. Its purpose is to take water out of Oak creek, a stream consisting of 4000 miner's inches, and to flume it to the edge of a bluff 260 feet high and to manufacture and transmit electric power to whoever wants it. Among the incorporators are H. J. Allen of the United Verde Co., D. J. Shea, J. F. Mullin and E. J. Parkinson. The outlook for these outside enterprises seems bright, and, if continued and successful, must ultimately prove of great benefit to the town of Jerome and relieve it from the charge of being a one-mine and one-man community.

Jerome, Feb. 22.

CALIFORNIA.

CALAVERAS COUNTY.

At Milton the Plymouth Rock mine has been again started up.

DEL NORTE COUNTY.

(Special Correspondence). — The Higgins Bros. & Jenkins placer mining property on Monkey creek has been bonded. The bonding parties have men working and developing the mine.

Extensive operations will soon begin on the Higgins copper mine, lately purchased by San Francisco men. There is a body of ore carrying copper and from $4 to $8 in gold and silver.

Crescent City, Feb. 24.

FRESNO COUNTY.

In the Coalinga district oil sand has been found by the Oil City Petroleum Co. at a depth of 450 feet.

HUMBOLDT COUNTY.

The Big Bar M. Co., owning 300 acres of auriferous gravel at the mouth of Slate creek, on the Klamath river, will resume work. H. Buhne of Eureka is Sec'y and A. Brown Supt.

INYO COUNTY.

The P. D. Q. Cyanide Co. have sold their 50-ton cyanide plant to R. C. Steele, Supt. Reward Milling Co.

KERN COUNTY.

In the Butte Lode M. Co. J. H. Underhill has sold the greater part of his interest and resigned the presidency. C. F. Howland is Pres. and Thomas Miner Supt.

The Randsburg Miner hears that at the Benson well at Goler a water yield of 72,000 gallons per day is assured.

A Pittsburg company will bore a 1000-foot hole on the same belt where the well finished lately by the Sunset Co. is situated.

The Kern River Pipe Line & Storage Co., operating the 4-inch pipe line between the wells of the Kern River Oil Co. and McKittrick, three miles in length, contemplates its extension to Sunset, thirty miles. The three-mile line, including storage tanks, cost $20,000. A 6-inch line from McKittrick to Summit would cost $150,000.

Seventy-two sacks of gold ore have been received at Bakersfield for shipment for reduction. The ore was mined at Greenhorn Mountain and is said by the owner, M. W. Solomon of Bakersfield, to run $100 to the ton.

Californian: Jewett & Blodget's oil strike is verified. In sinking well No. 17, at a depth of 700 feet, oil was struck in such volume as to cause a temporary suspension of operations. It rose in the 9⅝-inch casing to the top, and many hours bailing a 6-inch pump 20 feet in length only lowered the oil 50 feet in the well. The singular feature of this pipe is that it occurred in the first oil sand. Heretofore, in the other wells sunk at Sunset, the quantity of oil in the first sand was so insignificant as to be considered valueless and was shut off by the casing. Why there should be such a difference between the stratum of sand as shown here and in the other wells in that locality is puzzling oil experts. It is the intention, of course, to go down to the second sand.

KINGS COUNTY.

The Black Mountain Petroleum Co., working part of the property of the Krayenhagen Oil Co., is reported to have struck oil sand.

LAKE COUNTY.

The Abbot mine has a new 40-ton furnace, a new shaft house and hoisting works near completion. The Abbot last month turned out 130 flasks of quicksilver. Supt. Boggess says that in a short time its monthly output will be 300 flasks.

MARIPOSA COUNTY.

Merced stock came before Boston investors' attention in 1895; 100,000 shares were issued at $10, par $15; it advanced to 48⅝ and fell back to 18 within six months. It sold at from 6 to 14½ last year.

MONO COUNTY.

In the Standard Con. mine, at Bodie, for the week ending Jan. 31st, 282 tons of ore were crushed; average assay vanner tailings, $8.28.

NEVADA COUNTY.

Grass Valley men have a bond from Mrs. E. C. Huntington of New York on the Banner quartz mine. A company is to be organized to reopen it.

The Dublin mine, Nevada district, has levied assessment No. 2, ½ cent per share.

Tickell & Ritchie have sold to New York men the Champion quartz mine, Maybert district. The new owners will equip the mine with machinery and place it on a producing basis.

PLACER COUNTY.

A telegram from Forest Hill says that the Boston & South Dakota G. M. Co. have struck the Big Blue lead in an upraise from a crosscut from the main Weske tunnel. The company contemplate an electric plant on their Deadhorse ditch claim, and a mill at Turkey Hill to work the gravel coming from the Weske tunnel.

Pioneer stock was issued at $5 in 1895; 100,000 shares, par $10. The company paid dividends in 1898. Its stock sold from 2 to 8⅝ in '99.

C. A. Wikman, Supt. Jupiter mine, Iowa Hill, proposes to drive a tunnel to drain the mine.

RIVERSIDE COUNTY.

The Press reports striking $300 ore in the West Riverside mine, four miles west of Riverside.

SHASTA COUNTY.

(Special Correspondence).—The Texas Consolidated mine, ten miles north of Redding, has been bonded by the Bank of Tehama County to H. C. Woodrow for $60,000. The bonder is to keep six men continuously at work and make a payment on the purchase price in six months.

The Minnesota mine, near Copley, a long-time abandoned property recently bonded by D. McCarthy of Keswick, has been put in repair and is shipping ores.

Pump and power drills have been placed on the Black Spider mine, near Keswick, and three shifts are driving the shaft.

Kahny & Co. recently acquired ten claims in Flat Creek district and have begun work. Ore shipments have already begun from this property.

The Connors Salt Creek mine has opened a new ore body 3 feet wide of fair grade ore.

At the old Spanish mine, near Shasta, new development continues. The new steam hoist is in operation.

The DeShields claim, in Old Diggings district, is developing an ore body of good value.

At the Mt. Shasta mine a new ore body has been found at 305 feet depth, which ensures further work on a renewed and larger scale than has been the case for several months.

In the Bowry Bell mines development continues; about twelve men are employed.

The Mammoth copper properties, upon which the option had expired, will again resume development under the management of the Halifax people, who have also gained possession of the Ballakalala properties. The renewal extends to April 5th and calls for the payment of about $200,000.

Redding, Feb. 20.

SISKIYOU COUNTY.

(Special Correspondence).—The 40-ton cyanide plant, using the MacArthur-Forrest process, and owned by the Portland Gold Extraction Co., G. W. Ingalls Pres., A. S. Additon chemist, at Sawyer's Bar, started up to-day.

Sawyer's Bar, Feb. 23.

The Golden Star M. Co. has levied an assessment of ½ cent per share to make further development of their quartz ledge on Humbug creek, formerly the Spencer mine.

Miners at Quartz Valley and Oro Fino are carrying on extensive operations, with abundance of water. The hydraulic mines are being operated under the supervision of J. O. Rusby at Oro Fino.

The Etna Advance reports some stir in the Happy Camp region over the copper discoveries in the Preston Peak country.

The Journal reports at Ash creek blowing out from Downing & Meyers' quartz claim with a single shot about $1900 in gold, the quartz appearing almost like a mass of gold, with indications of finding a ledge.

TRINITY COUNTY.

Frank H. Hall, Supt. Maple Creek Hydraulic M. Co., near Junction City, operates one of the longest siphon lines in California, over 5000 feet in length.

TULARE COUNTY.

The Visalia Land Office has orders from the Secretary of the Interior to suspend from disposition 1,082,088 acres officially designated, which are likely to be declared mineral land.

A vein of oil is reported struck near Lindsay at a depth of 120 feet, while workmen were boring for water.

TUOLUMNE COUNTY.

Santa Ysabel stock was offered in 1895 at $5 per share; there were then 100,000 shares, par $5; the stock was later increased to 130,000 shares. The stock sold as high as 18 and as low as 6½ in '99.

YUBA COUNTY.

At Rackerby, on the San Jose Co.'s mine, a 5-stamp mill is busy. Five more stamps are to be added.

The Dewey Quartz M. Co. have a mine and mill two miles north of Rackerby.

COLORADO.

CHAFFEE COUNTY.

News: The leasers on the Whale have suspended operations on that property,

owing to the smelters advancing the charges for treatment on this class of ore. It is the opinion of experienced mining men that if this raising of treatment charges on low-grade ores continues that properties producing such ores will have to ultimately close down permanently. It is the large bodies of low-grade ore that made Colorado what she is to-day, and not the small streaks of ore of a higher grade. Why do the smelters make such discrimination in treatment charges against small shippers and in favor of larger producers?

CLEAR CREEK COUNTY.

At Georgetown, the Doric Gold Mines Co. has decided to reorganize the company, and work on the property will be resumed.

EAGLE COUNTY.

The Newhouse tunnel is penetrating Battle mountain. It will be 2700 feet in length and will command a square mile of mining territory. It is now in 400 feet.

EL PASO COUNTY.

Another chlorination plant, to cost $500,000, is to be built in Colorado City by the Standard M. & S. Co. The mill will have a capacity of 400 tons a day.

FREMONT COUNTY.

At Florence is building the reduction plant of the Union Gold Reduction Co. to treat the ores from the Vindicator mine of Cripple Creek. The mill will have a daily capacity of 300 tons, and is expected to be finished by Sept. 1, 1900.

GILPIN COUNTY.

Register-Call: New incorporations are: Fourth of July G. M. Co., to operate in Gilpin county; stock, $1,500,000; the Avon M., M. & Power Co., to operate in Gilpin county, with office in Denver; stock, $1,500,000; the Colorado Mountain M. Co., to operate in Pine district; stock, $1,000,000. The Avon M., M. & Power Co. intends to build a 250-ton concentrating plant on North Clear creek. The company owns the Avon mill, Avon millsite, Nugget placer and water rights on North Clear creek. The mill will be in three sections, independent of one another, and each will be driven by a 43-inch wheel, ore being delivered at the mill by the tramway company and handled automatically in the mill from start to finish, dropping down six terraces during the process. The mill will use rolls.

GRAND COUNTY.

A Boston company has bought 2000 acres of placer ground in Middle park, at the head of Willow creek, and will actively work it next season.

GUNNISON COUNTY.

In the Good Hope mine, Vulcan district, owned by Weiss Bros. of Del Norte, Supt. Dillon reports ore in the east drift of the fourth level, 40 feet from the shaft; it is several feet in width, runs from $300 to $1000 per ton, and is quartz spotted with native tellurium.

LAKE COUNTY.

Chronicle: The Leadville miner is now getting the best price for lead since 1882, when the average price was $4.91. He is now receiving $4.57½ per hundred, as against an average price of $4.27 in 1899 and $3.63 in 1898. For years past the smelters were governed by the "brokers' price," about 25 cents per 100 pounds below regular quotation. The smelters have done away with this brokers' quotation, however, and now pay the miner on the basis of the New York market price, less 12½ cents per 100 pounds, which covers the expense of selling the ore, insurance, commissions, etc. The price for the current week is fixed by the average price of the week previous, and this week settlements are made on the basis of $4.57½. This has been the ruling price, plus 12½ cents, since February 1. One of the results of this increase in lead price has already been noted in the increased production of low-grade lead ore. The first upward tendency was seen in the latter part of 1898, and the increase in 1899 was 17⅝%. The next increase is this last, which is a gain of 7⅝ over 1899, with a generally rising tendency. This gives encouragement for such properties, which with lead down to 3 cents cannot be operated. In 1890 Mr. Blow, then manager of the Silver Cord property, said there were several million tons of low grade lead-sulphide that could be mined through the Silver Cord tunnel. Mr. Blow's idea was that concentration was necessary, but probably the greater part of the material can be handled without any preliminary treatment. A new concentrating mill at the mouth of the tunnel is one of the possibilities. The difference in the value of lead ores is probably best shown by taking the example of an ore carrying, say 14%. In December, 1898, this lead would be worth to the miner $3.36, while at the present time the same lead would be worth $6.51.

OURAY COUNTY.

Ouray reports an assay of ore from the new strike returning 334 ounces in silver and nearly one ounce in gold—a piece of gray copper taken from the surface of the workings of the Trout. It is a blanket vein, and is believed to extend under the town. The vein rock averages fifty ounces in silver, carrying lead and copper values. The strike on the Fisherman returns $20 in gold per ton.

SAGUACHE COUNTY.

The San Luis Valley L. & M. Co. has bought the Baca grant No. 4, comprising nearly 100,000 acres and taking in a large part of the Saugre de Christo range. The Mgr. of the property will be H. B. Davis of Colorado Springs. It is stated that during next year $1,000,000 will be spent in developing and improving the mineral resources of the purchase.

SAN MIGUEL COUNTY.

Post: The Animas Smelting & Refining Co. has incorporated with 100,000 shares at $1 per share. Twenty thousand dollars will be available at once to build a copper matte smelter at Silverton.——T. Allen, Supt. Sampson mill, near Howardsville, has bonded his mine to an Eastern company, which will immediately begin work. Mr. Allen will place a 10-stamp mill at the top of the hill on the Animas river to treat these ores.

SAN JUAN COUNTY.

The Stoiber tunnel is in over 800 feet. The timber sets are 4 feet apart, timbers 12 inches square, red spruce, lagging squared and of the same material. The tunnel is 6 feet wide, 8 feet high in the clear, and is ditched. The tunnel when completed will be three miles long.

TELLER COUNTY.

W. S. Stratton has bought the Temomj mine, on Gold hill, adjoining the Moon-Anchor mine, for $300,000.

At the Anchoria-Leland the News says that in a level drawn from the bottom of the deepest shaft on Gold hill, at a depth of 1000 feet, the miners have cut a 3-foot vein of sylvanite that runs high in gold—fifty to seventy-five ounces.

Times-Citizen: The Burch lease on the Republic of the Mary McKinnie sent out a four-carload shipment of ore that will all average five ounces of gold to the ton. The production of the McKinnie last month amounted to $80,000. In the north drift of the 400-foot level they are drifting on a vein that is 18 to 24 inches in width that will run $200 to $300 to the ton.

Victor Record: The machinery on the Electric claim of the Freeport and Cripple Creek Co. has been removed and the shaft house torn down. The claims of this company, which is much vaunted by a Boston syndicate, lie a mile and a half west of the city. It has been claimed for the property that it was producing ore netting the company $100 a day. A visit to the workings found the property practically deserted. The claims are in the granite without a semblance of such eruptive contact rocks as porphyry, phonolite, andesite or even breccia. Prospectors in the vicinity deny that any ore has ever been shipped and there were certainly no indications of ore around the deserted shaft. ——The Gillett Gold Extraction Co.'s mill has started ore treatment. The company has 1000 tons on hand and contracts ahead.——Mgr. Kline of the Coriolanus has returns on a twenty-ton shipment of smelting ore. The consignment was settled for on a basis of six ounces to the ton.

IDAHO.

SHOSHONE COUNTY.

The Blue Grouse M. Co. at Wallace say that the $10,000 on the bond on the property will be taken up when it becomes due next month. The price at which the bond was taken was $20,000, one-half of which is paid. The company has run an upper tunnel 300 feet through ore and started another one 211 feet lower, showing ore all the way, and part of the time producing a grade which will bear shipping at present prices of lead and silver.

MICHIGAN.

HOUGHTON COUNTY.

At Houghton the Calumet & Hecla Co. has 5000 men on its payrolls. The mines are at Calumet, the stamp mills at Lake Linden and the smelters at South Lake Linden, Black Rock and Buffalo. Practically every part of the property is duplicated, from the hoisting engines to the smelters.

MONTANA.

LEWIS AND CLARKE COUNTY.

At East Helena, across Prickly Pear creek, the smelter company has built a dam for a lake or storage reservoir from slag from the furnaces. The molten slag was run directly from the furnace into a sluice of water, the contact granulating it.

MADISON COUNTY.

The hydraulic pump at the Pole creek placers is the largest of its kind in Montana, giving a head of 2000 miner's inches. The placers are being operated by the Montana Hydraulic G. M. Co., a Toronto corporation.

The Red Bluff M. & M. Co. is operating the Red Bluff mine.

The Pay Rock is being operated by Butte men.

At the Madisonian mine, near Norris, the deal for the sale of the property is off, the option held by British Columbia and Spokane men having expired.

The Thompson Investment Co. of Butte has bought the Klondike claim, near Leiterville, for $10,000.

SILVER BOW COUNTY.

The crosscut on the 1200 level of the Parrot mine reached the ledge and cut through between 40 and 50 feet of fine copper ore.

NEVADA.

EUREKA COUNTY.

Sentinel: As an experiment, the Eureka Con. M. Co. this week made a shipment of ore to the Selby Smelting Co. in California, the object being to determine whether or not Eureka ores can be more profitably sold to the Selby Co. than to the Trust smelter at Salt Lake City. The class of ore shipped will average about $37.50 per ton. The freight rate on this class of ore to Salt Lake City is $8.25 per ton, while to the Selby plant it is $9.50, making a difference of $1.25 per ton. The favorable schedule offered by the Selby Co. on lead ores that carry 20% lead and a return of all gold contained therein has caused our shippers to do some figuring, and they are convinced that they can pay the additional $1.25 freight charges and still get better returns from the California plant than from Salt Lake City.

LINCOLN COUNTY.

The De Lamar Miners' Union have presented the widow of C. J. Pettee, late editor of the Local Messenger, with $60.

LYON COUNTY.

A carload of copper ore shipped to Selby's from the Daniels mine in Mason valley netted $20 per ton—about 15%.

The Gregory copper mine, near Dayton, has resumed work.

WASHOE COUNTY.

Olinghouse placer miners are getting ready to resume sluicing gold.

WHITE PINE COUNTY.

W. B. Lawler of Salt Lake has bonded the Johannah group of gold mines, eight miles south of Cherry Creek, for $17,000.

OREGON.

BAKER COUNTY.

T. L. Lammers, Mgr. Columbia M. Co., has from G. W. Grayson of Oakland, Cal., a bond on the Climax mine in the vicinity of the Columbia, and will develop the property.

Geo. Chapman is about to reopen his custom mill at Sparta. Supt. Perkins will unwater.

The old Gem mine near Sparta, which is under bond, has a shaft 165 feet deep, and will be sunk 100 feet deeper.

JOSEPHINE COUNTY.

The gold dredge Josephine, near Waldo, has resumed operations.

The quartz mill on the Winnington-Pence mine, on Forest creek, is running on rock reported to average $36 to the ton.

TEXAS.

Cinnabar ore is reported being mined in paying quantities in the Texas peninsula, in the southwestern part of the State, near the Rio Grande river. The ore is hauled ninety miles by wagon to the Southern Pacific road.

UTAH.

SUMMIT COUNTY.

Mgr. Jno. J. Daly sends a report of the Daly-West M. Co. for the period from Dec. 31, 1898, to Feb. 19, 1900. During 1899 the company at Park City extracted and marketed crude ores and concentrates of the gross value of $549,721.14, and expended for labor, supplies, etc., $171,810.05. Mgr. Daly calls attention to the purchase of the Morgan group of mines at a cost of $108,000, and to improved facilities for transportation of ore. Formerly the transportation of ore from the mine to the depot cost 85 cents per ton; for up-freight, consisting of coal, etc., the company paid $1.40 per ton. Now it costs 15 cents per ton, both ways. During '99 there was mined and marketed 7792 tons ore, which contained 495,484.90 ounces silver, 3,988,891 pounds of lead, 461,288 pounds of copper and 406.63 ounces gold that sold for $334,445.54. Crude ore was treated at the mill amounting to 17,169 tons, which contained an average of 10.3% lead and 20.3 ounces silver per ton, from which 90% lead and 68% silver was saved. This crude ore was reduced to 4785 tons of concentrates with an assay value of 33.46% lead and 49.8 ounces silver per ton, which was sold to the smelting company for $194,571.68. This ore also contained a small percentage of gold and copper, which was settled for and which is included in the total. A supplemental report from Jan. 1 to Feb. 19, 1900, asks that the ore now exposed be worked, in view of the present lead market, which is almost sure to hold for ten months, but liable to decline hereafter. It is understood that J. E. Bamberger will be the acting manager and Jno. A. Kirby Supt.

TOOELE COUNTY.

(Special Correspondence). — Stockton, the first "gentile" town in Utah, the initial point of the mining industry in "Deseret," was established by Gen. P. E. Connor, in 1862, who camped at the head of Rush valley just prior to his march to Salt Lake City and the establishment of Fort Douglas. His command comprised 850 men, made up of California volunteers. Many of the latter were California miners and prospectors who were encouraged by their commander to explore the country from a miner's standpoint. Through the latter's assurances of protection to miners and prospectors other men soon came and within a year claims were staked at Stockton, Bingham and Camp Floyd (now Mercur). The Jordan lode was located in 1863 and the following year the Jordan M. Co. incorporated and on the property a tunnel was driven at a cost of $60 per foot.

In 1864 Gen. Connor and associates erected the Pioneer smelter at Stockton, which was the first reduction plant established in the intermountain region. A year or two later a second smelter was built, having a reverberatory furnace. The ores were found to be silver-lead and iron, being carbonates and sulphides, to handle which the California placer miner had to learn new lessons in metallurgy. But, however expensive, those lessons were learned and the business of mining spread from the Oquirrh to the Tintic range and to the lofty spurs of the Wasatch. As a result, we have to-day such camps as Bingham Canyon, Tintic, Mercur and Park City, where great industries are firmly established, where thousands of people are employed and millions of dollars are produced.

The Honerine and Basin claims at Stockton were located and work thereon commenced in 1864, and the two were afterwards consolidated. For years the group was successfully worked, the production amounting to over $2,000,000. By 1890 it was worked down to the water level, requiring pumping facilities, and the silver depression of 1893 closed it down. The property is now owned by Boston parties, with C. H. Scheu as Mgr. and E. J. Raddatz as Supt. Work has been resumed, and, as has been noted, equipment to pump water by compressed air has been provided; and it is expected the water will soon be lifted from the lower levels and shipments resumed. The original workings consisted of a tunnel running southward on the Honerine and an incline on the Basin on the opposite side of the ridge, tunnel and incline running toward each other on the same fissure. The tunnel advances 3500 feet and the incline sinks 700 feet, the two being connected by a 600-foot level, making 4800 feet of continuous work on a north and south ledge. In the course of the tunnel several blue lime veins were crosscut. At the intersections of those east and west veins with the north and south fissures is where the richest ore is found. The latter trends along a porphyry dyke and the east and west veins are between blue and gray lime walls. The gangue material is an oxide and sulphide of iron, interspersed with streaks of talc. Down to the water level the ores are largely carbonates, changing to galena, or sulphides, at and below the water level. At a point in the tunnel, nearly 3200 feet from the entrance, a shaft sinks 145 feet on one of the veins, at the bottom of which a station pump is set and ready for work. A hoist is set at the collar of the shaft and as soon as the water is out sinking on the shaft will be resumed. At the tunnel entrance is the air compressor and other equipment. A force of thirty men is employed at present. It is considered by many that the results of deeper workings in the Honerine will be to some degree a demonstration of value to other mines in the district. There are about 60,000 tons of mill tailings at the old Connor mill in Stockton which it is believed will be treated in the near future.

The Ben Harrison mine, belonging to the Stockton G. M. & M. Co., located in Soldier Bridge canyon, is opened through a 1300-foot tunnel, which parallels the quartzite formation and crosscuts a number of lime veins, some of the last-named being from 10 to 30 feet wide. The ores show fair values in lead, silver and gold. Development work is progressing under the superintendence of H. D. Trenam.

The Lion Con. Co. have a large group of claims in the same locality. An incline sinks 300 feet, going against the dip of the vein and cutting it at 150 feet, where the ores were a silver-lead carbonate. From this level the ores on the vein were stoped out to the surface for several hundred feet longitudinally. On the opposite side of

the ridge a tunnel drifts on the vein to connect with the workings through the incline. In this mine, as in others, the valuable ores are in the east and west veins that cut the porphyry formation at right angles. A shaft is to be sunk at a point lower down the slope, from which drifts eastward will be run to cut below present workings. This group is under the management of F. E. Wilson of Salt Lake City.

The Silver Coin group, in charge of Supt. Alex. Maze, is a new property and is being developed by a tunnel which is in about 400 feet. In this distance two of the characteristic blue lime ledges have been cut, which yield good silver-lead values, the ores seeming to be a mixture of galena and carbonates.

The Hercules comprises four patented claims on which development was begun three years ago. The property is managed by E. P. Michenor, who states that it has been on a paying basis since the time the shaft reached 100 feet depth. I. A. Benton and H. E. Zerbe of Salt Lake City are interested with Mr. Michenor in the property. An incline shaft is down 350 feet, following the dip of an east and west vein, from which drifts run on the vein in both directions. From one of the lower drifts an upraise has been made 265 feet, all the way in ore, and connecting with a winze from the surface. The walls are a quartzite on the north and south veins and a dolomite lime on the east and west veins, the latter having a blue lime gangue. The greatest values are in chimneys at the vein and fissure intersections. It is estimated their lowest workings are still about 100 feet above the water level.

The Bunker Hill, comprising three patented claims, is developed by a shaft 200 feet deep, which goes down on the vein, on which there are drifts aggregating 450 feet. The vein characteristics here are similar to those on the Honerino and others. The ores run high in silver and lead. A steam hoist will soon be put up, after which the shaft will be sunk deeper. A recent shipment of forty tons of ore is said to have netted about $50 per ton. J. C. Reynolds is Supt. of the Bunker Hill.

The Rush Lake is the name of a group of claims on which is a 120-foot shaft and is equipped with steam hoist. This has produced some good ore, and Mr. Reynolds, the owner, states that developments are to continue.

The Catherine is one of the old mines of the sixties and was quite a producer for several years. The workings are through a tunnel that was driven on the vein, connecting with a shaft that sinks 600 feet from the surface. The ores here are characteristic of those of the district. It is in charge of J. Collins.

The Grand Cross, in Soldier canyon, is under bond to McDonnell, Thomas and Murray, whose time extends two years. A tunnel being driven is in 900 feet, five shoots of ore having been crosscut in that distance, it is stated. Some ore has been taken out and a shipment is expected to be made about March 1st.

The general condition of mining in Stockton district is one of improvement, and it seems easy to foresee greater activity. About 150 men are employed in the district and the payroll for January, 1900, amounted to about $6000. WASCOTT.

Stockton, Feb. 19.

(Special Correspondence).—Work in the Northern Light mine at Mercur aggregated 1967 feet within the past year. The gross earnings of mine and mill amounted to $19,223, the expenditures amounting to $27,119 for the year. The mill was closed down last October at the conclusion of a four months' run of 2223 tons of ore.

The employes of the Daisy mine and mill at West Dip, Mercur district, took control of operations last week and are to apply the proceeds on wages due them.

Mercur, Feb. 22.

The directors of the Overland M. Co. have ordered the bonding of the proposition for $150,000 for improvements. The shareholders will ratify on 17th inst.

The Tribune says that a consolidation of DeLamar's Mercur mines and those of the Mercur M. Co. will soon be accomplished. Pres. J. Dern of the Mercur and Capt. DeLamar of the other side have arranged to meet in Paris this month.

WASHINGTON COUNTY.

The furnaces of the St. George C. M. Co. have started on Dixie ore.

WASHINGTON.

OKANOGAN COUNTY.

(Special Correspondence).—Naturally, a great interest attaches to the first location in any mining section, and particularly so if it prove to be a winner, and it is a singular fact that, in almost every instance within the last thirty years, the first location has so proven in every prominent mining camp in the United States. Here on Palmer mountain the first location has not only been proved a winner, but it has the distinction of being the first quartz lode carrying gold in paying quantities located in the State of Washington, and is now about to resume operations. This is the Black Bear, which, with a sister location—the War Eagle—were merged into the Black Bear-War Eagle G. M. Co., incorporated, capital $1,000,000. Improvements are now nearly complete, and it is expected to start five stamps dropping on March 1st and the others as soon as they can be installed. While at the Black Bear mine, the main shaft has been sunk to 250 feet, two compartment, and timbered all the way down. A 22 H. P. gasoline hoist (see illustration, first page) has been installed with self-dumping buckets and ore bins of large capacity, and the ore will be wagoned to the mill two and one-half miles until the wire tram is completed. The Black Bear has three parallel veins cropping on the surface, the shaft being sunk on the first, and a drift has been started from the bottom to cut the other two lying to the north, which will be over 200 feet in length and will be the deepest workings. A level was run from the shaft at 100 feet both east and west and about the same amount of levels at 150 feet. In both these levels stoping and drifting develops ore sufficient to run the mill one year. The ore averaged $24 in the batteries and on the plates, and no concentrates or tailings were saved or treated in former working; better results are expected from now on. At the War Eagle the shaft will be sunk to 250 feet and drifts run east and west on the vein. Both these mines were filled with water until six months ago, when the Palmer mountain tunnel cut the War Eagle ledge in their own ground, the Wisconsin Central at 1000 feet depth and drained both the War Eagle and Black Bear, indicating a vein running diagonally from the Black Bear to the War Eagle, through which the water was drained. The former working of the War Eagle showed the ore to be of $21 average value.

The vein cut in the Palmer mountain tunnel within the Wisconsin central lines (known as the War Eagle vein) was 42½ feet wide and contained 35 feet of ore averaging $35 in value; 8 feet of it assayed $176.83. The diorite formation through which this vein cuts assayed more than $3 for several feet each way from the walls.

The Palmer mountain tunnel, since cutting the War Eagle vein when in 2000 feet, has in the next 800 feet cut seven more veins, or one for nearly every 100 feet run; they average from 2 to 8 feet in width and carry from 12 inches to 4 feet of ore, the average of which is $28. This company is about beginning the improvement of a water right one mile from the portal of the tunnel, which has a 370-foot fall and 5000 miners' inches of water at the driest season of the year. Their consulting engineer informs them that this will give them 3000 H. P. Electrical machinery will be installed capable of transmitting power twenty-five miles, which will be both profitable to seller and economical to user. They have also been advised that they will, by the aid of concentration and cyanide, be able to save 97% of the values of their ores, and the different reports of experts make 75 cents per ton the minimum and $2 the maximum for mining and treating. They are now considering propositions for a plant; the deciding upon, manufacturing and installing will consume the better part of a year's time and the outlay of a large sum of money. They expect to reach the Black Bear vein in from 500 to 700 feet farther in the tunnel. This will be in their own property—the Helena Belle—but only a few feet from the end line of the Black Bear. Perhaps it should be stated that the Black Bear and War Eagle are entirely surrounded by the tunnel locations—some fifty in number—all contiguous, six having recently been added to the forty-four mentioned in a recent letter. This aggregation of claims are situated on the southern slope of the mountain, extending from base to summit.

Perhaps the next two most promising properties on Palmer mountain at this time are the Bull Frog, on the northwestern slope of the mountain, and the Wehe Con., on the southeastern slope, both of which are attracting attention.

The Wehe Con. consists of twenty-six locations, through which run several parallel veins, two of which are very prominent, one cropping for 9000 feet and the other for 6000 feet. The principal work is being done on the large vein. A 500-foot, two-compartment vertical shaft is now down nearly 200 feet, and, as soon as a hoist is installed, will be continued to 500 feet, with levels run every 100 feet to the vein. A 500-foot tunnel is also being run on this vein, which will gain 300 feet in depth, while a 500-foot tunnel is being run on the other vein. This work is all under contract and the hoist is now en route; 100,000 feet of timbers and lumber is under contract and is now being delivered, and the opening of spring will see many surface improvements. It is hoped that by July 1st a treatment method can be decided upon. The ore is a sulphide carrying $20 in gold values and quite an amount of silver, the average of which has not been ascertained. The company was financed by North Dakota and Cincinnati men.

The Bull Frog is composed of fifty mining locations and six mill sites. Through these fifty contiguous locations are running sixteen parallel veins of good width, showing good gold values. The principal work has been done on the Phantom location, through which runs the sixteenth cropping vein. A shaft is down 130 feet, and from the bottom a drift has been run 142 feet. In so doing they have cut through ore bodies from 4 to 8 feet in width in the last 85 feet; the formation between gives a small assay. Clear across the average of the ore is $19.50 and yields easily to cyanide treatment, there being no copper in the ore. The company own a cyanide plant, which is under the new organization and management, being reinstalled at a more convenient location. A hoist will be put in and the shaft put down to 500 feet, with levels every 100 feet, to prove the ore bodies now cut. A 2000-foot tunnel would crosscut the whole sixteen veins and gain nearly as much depth. What is noticeable upon Palmer mountain is the frequency of parallel veins and the grouping of so many contiguous locations in one property, the topography of the mountain being favorable to this method of mining and gaining great depth.

Loomis, Wash., Feb. 20.

WYOMING.

Prof. W. C. Knight of the University of Wyoming ascribes the failure of this State to produce a Leadville, Deadwood or Butte to the custom of shallow mining there. "There is not a shaft in the State, so far as I know," he says, "that is 300 feet deep, and yet from shallow workings of this kind prospects have produced from $40,000 to $200,000." Inexperienced miners, a loose system of mining and dishonest manipulation, he says, have been the stumbling blocks in the way of big successes in the mining industry of Wyoming.

FOREIGN.

BRITISH COLUMBIA.

Almost the entire production of the War Eagle mine, says Mgr. Kirby, has been derived from its main vein and from a single ore shoot in this vein. This shoot has a dimension of 300 to 450 feet along the vein and has now been exposed to the sixth level—a depth of 755 feet measured on the vein. It is so located that its median line roughly coincides with the line of the main shaft. As usual, the vein area included within the shoot limits carries pay ore in irregular patches or masses interspersed with barren material or ore too low in grade for profit. The different pay ore bodies vary in grade from $30 or $40 down to the pay limit. The structure is somewhat complicated by numerous dykes and faults and by branching of the vein. Moreover, its width in places and the irregular distribution of the pay bodies increase the proportion of development work necessary. About 640 feet east of the shaft the main vein is crossed at an angle of 55° by a smaller vein. In it an excellent ore body, apparently another ore shoot, has recently been discovered. It has a dimension along the vein of 120 feet, an average width of 11.1 feet and has been stoped to the surface 50 feet above. This stope has yielded 5966 tons, averaging $23.38 per ton, smelters' gross assay value. A winze has been sunk 60 feet in ore, but the work has not yet gone far enough to prove the limits or continuity of the ore body. So far as known, the first four levels are practically worked out. There are some small remnants, and future prospecting may add something to their tonnage, but there is no reason to expect any important additions.

Miner, in Boundary district: There are about 175 men working in Camp McKinney.——The Sailor shaft is down 200 feet, and it is intended to put in a seven-drill compressor.——It is expected that work on the pyritic 250-ton smelter, to be built at Grand Forks, will be started next month.——Five tons of ore from the Review mine, at Chesaw, are shipped for test to San Francisco, New York and Chicago.——Roasting of ore in heaps will be started at the Granby smelter by April 15th. Final payment of $11,000 has been made on the bond of the Red Rock claim in Greenwood.

SOUTH AFRICA.

Consul-General Stowe writes from Capetown: "The mine owners of the Transvaal are not idle, but have their engineers and draftsmen at work preparing plans, and orders are being placed somewhere for mining machinery and plants to replace what may be destroyed or injured and in anticipation of new operations and increased business. Many new plants are lying at seaports, stopped in transit. The coast cities are preparing their docks, now inadequate and crowded beyond their capacity, for the great influx of goods when the strife is over. Cape bay is crowded with vessels; as many as eighty to ninety have been counted at one time. I desire to impress upon American manufacturers the necessity of earnest effort and prompt shipments to gain this trade. It is to be regretted that orders are being refused or accepted and held back by American manufacturers in the fear of non-payment. Such action may seriously affect future business. If they are unable to fill orders, they should not hesitate to say so; but they should not accept and fail to ship."

Industrial Notes.

—A railroad is to be built from Ione to Jackson, Cal.

—San Francisco pays annually $1,000,000 for telephone service.

—Oil as fuel for welding is now used by the Southern Pacific Co.

—Dry weather in Arizona interferes with all industrial projects.

—A telegraph line is to be built this season from Ashcroft to Atlin, B. C.

—Less than the normal amount of snow is reported in the California Sierras.

—California oil companies are being incorporated at the rate of three daily.

—The Everett & Monte Cristo, Wash., Railroad is to be repaired and rebuilt as far as Silverton.

—In the U. S. Senate has been introduced a bill appropriating $250,000 for the construction of a U. S. mint at Portland, Or.

—The Denver & Rio Grande Railway has ordered fifteen consolidation locomotives, to have 22x28 cylinders and weigh 190,000 pounds each, without tender.

—The Southern Pacific will make the Carson & Colorado road a broad gauge line and extend it from Keeler southwest to Mojave, Cal., a distance of eighty miles.

—The Western Union Telegraph Co. has bought all the lines of the Deseret Telegraph Co., extending throughout Utah and to Mormon settlements in Idaho and Nevada.

—Gen. A. W. Greely, Chief Signal Officer, U. S. Army, says that the energies of his department are being directed toward the establishment of a thorough telegraph and telephone system in the Philippines.

—Mgr. Grant of the Utah and Sioux mines and the Farrel mine says that Messrs. Farrell, Grant & Wallace of Utah, if co-operation is secured, will build a smelter which will be operated independently of the trust.

—It is expected that at the annual meeting of the American Steel & Wire Co. steps will be taken to absorb the American Mining Co., the American Steamship Co. and the American Coke Co. of Pennsylvania. The capital of each is $1,000,000.

—Carlie, Dittmar & Weitbrec have the contract to build the west end of the Colorado Springs & Cripple Creek Railroad. About seventeen miles of grading is to be done; the cost will be near $600,000. They expect to employ about 600 men and finish by Nov. 1, 1900.

—The Denver Union Water Co. will begin work on the new power plant on the south fork of the Platte river. The dam is being constructed by the company at the junction of the south fork of the Platte river and Goose creek, forty-five miles from Denver. In connection with the dam and Cheesman reservoir the company has planned a power plant to furnish cheap manufacturing power for Denver.

—Consul Stowe, writing from Cape Town, suggests that contracts for the building of railroads, for supplying the army, jails and the public institutions are open for bids, and the consul advises American exporters to make preparations now for the commercial invasion of South Africa after the war is over. Wants of every description will then have to be supplied, and the consul observes that it behooves American manufacturers and producers to be prepared to obtain a part of this trade.

—From 1877 to 1898 the output of coal in Russia rose from 1,774,193 tons to 12,032,258 tons; pig iron from 370,967 tons to 2,161,291 tons; steel from 48,387 tons to 1,451,612 tons. It is said that there is a dearth of coal in Russia, the native mines no longer being able to keep pace with the needs of metallurgical works and railways. The demand for coal has much increased of late years, owing to the dearness of wood. It is intended to relieve the situation by a diminution of the duty on foreign coal, and to increase the output of iron by giving over to private enterprise the government mines of the Ural.

Personal.

JOHN B. STEIGER has returned to Montana after a four years' absence in South Africa.

ALBERT HOLDEN, Pres. Centennial Eureka of Utah, has returned from Central America.

W. H. NUTTING will superintend the construction of the pyritic smelter at Bingham, Utah.

MACDONALD AND HUGHES of San Francisco are examining Shasta county, Cal., mining properties.

AUG. MATHEZ goes to China for Samuel Newhouse, who has government mining concessions that are to be exploited.

L. A. GROSS, Supt. Centennial mine, Drytown, Cal., is visiting mining property in which he and associates are interested at Ewen, Or.

F. CORKILL, former Supt. Dead Horse mine, Tuolumne county, Cal., is now connected with F. M. Smith's borax workings in southern California.

THE Council of the University of Tasmania recently asked the University of California to nominate a Professor of Mining. Frank A. Rich, a graduate of the College of Mining, has been named for the position.

W. C. RALSTON, Pres. California Miners' Association, has appointed as delegates to the International Mining Congress at Milwaukee, Wis., to represent the Association Lieut.-Gov. J. H. Neff, W. S. Keyes, J. W. C. Maxwell, J. F. Halloran.

STATE GEOLOGIST GALLAGHER of Missouri states that "within the next five years Missouri will startle the world with the great amount of lead, zinc, copper, nickel, cobalt and coal mined in the State. Missouri is rich in these minerals—the richest of any State in the country."

T. H. OXNAM, mine manager, and H. A. Cohen, financial manager, for Capt. De Lamar, have returned to San Francisco from Bully Hill. Plans for the new smelter are about completed. Sidney Sprout and C. W. Waller of San Francisco are examining feasible electrical sites on Pit river, Cal.

Commercial Paragraphs.

THE Robbins Conveying Belt Co., New York City, has moved its offices to the Park Row Bldg., occupying the North tower. Its machine shop is being removed to Passaic, N. J., where a complete factory is established.

THE Jeanesville Iron Works Co. of Jeanesville, Pa., report finishing a triple expansion condensing mine pump of the following dimensions: Diameter of high-pressure cylinder, 16 inches; intermediate, 24 inches; low pressure, 40 inches; diameter of plungers, 16 inches; stroke, 48 inches; length over all, 46 feet 9 inches; width, 11 feet 6 inches; height, 9 feet 9 inches; capacity, 3500 to 4000 gallons per minute against 300 feet head. Pump, complete with condenser and fittings, weighs 175,000 pounds. The condenser is independent duplex type, size 10x12x18 inches. This is the first pump having Corliss valve motion to be erected at the Jeanesville shops, and has been christened "The Monarch."

Catalogues Received.

Catalogue No. 40 of the M. C. Bullock Mfg. Co., 1170 W. Lake St., Chicago, treats of portable hoists, their construction and design, with sectional drawings, tables of sizes and styles in detail, and description. It will be sent free anywhere upon application.

Smooth-On Mfg. Co., 32 pp., 12 mo.; explaining process of manufacture, practical value and use of their iron cement; of interest to everyone having anything to do with anything made of iron. The booklet will be sent free of charge to anyone anywhere by addressing the Smooth-On Mfg. Co., 547 Communipaw Ave., Jersey City, N. J., or their Pacific Coast Agts., Madison, Bruce & Sellers, 34-36 Steuart St., San Francisco, Cal.

Recently Declared Mining Dividends.

Bunker Hill & Sullivan Mining & Concentrating Co., Idaho, $21,000; March 3.

Westlake, Cal., Oil Co., 2%; March 1.

Independence T. & M. Co., Colorado, 1 cent per share $12,500; March 1.

The American Smelting & Refining Co. will distribute a double dividend this month.

Homestake M. Co., South Dakota, 25 cents per share, $52,500; Feb. 25.

Raven G. M. Co., Colorado, $10,000; payable March 20.

Pennsylvania M. Co., California, 10 cents per share; March 1.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR THE WEEK ENDING FEB. 20, 1900.

643,857.—EXCAVATOR—E. M. Zahl, Portland, Or.

32,252.—DESIGN—C. P. Littlepage, Ballena, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PROTECTOR AGAINST STEAM FROM KETTLES.—Coby Lorenzen, Oakland, Cal. No. 643,877. Dated Feb. 20, 1900. When vessels such as tea kettles which are used to boil water and other like purposes, have to be again filled with water, it is usually necessary to remove the cover from the top and this allows a volume of hot steam to escape which is dangerous to the operator. This invention is designed to protect the user from this steam and to provide for the filling of the kettle without allowing this volume of steam to escape in such a manner as to injure the user. The attachment consists of a flanged cover adapted to be seated in the top opening of the vessel and formed rigid, with a receiver which is provided with a removable supplemental cover. This receiver has a tubular extension from its lower end which projects to a point near the bottom of the vessel, and the cover has a steam discharge at one side protected by an enclosing hood.

CREMATORY CARRIAGE.—Peter Beanston, San Francisco, Cal., assignor to G. R. Fletcher, of same place. No. 643,837. Feb. 20, 1900. This invention relates to a carriage which is designed for use in connection with a crematory furnace. It consists of a lower and an upper carriage, the first named traveling upon a permanent track to advance it to a certain point with relation to a furnace front. Means carried by the apparatus serve to check the lower carriage at this point, at the same time allowing the upper carriage to move forward upon the lower one so as to project the support of the body into the furnace, and at this point the upper carriage is checked, and there are means for lowering and depositing the body upon a supporting cradle where it is to be destroyed. After the body has been thus deposited the carriages are successively returned, the upper one upon the lower, and the lower one withdrawn to its normal position.

Obituary.

JACOB PFAFF, president of the Buckminster, Cal., quicksilver companies and Santa Ysabel, Cal., G. M. Co., died in Boston last week, of paralysis, aged 71.

Latest Market Reports.

SAN FRANCISCO, March 1, 1900.

SILVER—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 59¾ cts. (1000 fine); San Francisco, 59¾; Mexican dollars, 48½c.

According to recent report of the directors of the French Mint, the gold produced in the last fifteen years has been worth $2,500,000,000, of which the Transvaal has yielded $386,000,000. In the arts there have been used 200,000 pounds, while coinage annually requires an amount varying between 660,000 and 1,320,000 pounds, apart from recoinage. There has been a constant increase in the output of silver, in spite of the fall in price from $42.46 per kilogram to $19.30. The production has risen from 3000 tons in 1888 to 6000 tons in 1898. Two million two hundred and fifty thousand pounds are absorbed in the arts, the United States being the largest user for industrial purposes.

COPPER.—New York: Lake, 1 to 3 casks, 16.75 cash; carload lots, 16¼; Electrolytic, 1 to 3 casks, 16.50; carload lots, 16.00; Casting, 1 to 3 casks, 16.25; carload lots, 16.00. San Francisco: 17½@18. Mill copper plates, 21½c; bars, 23½@25c.

It is reported that the Calumet & Hecla M. Co. has sold 15,000,000 pounds copper to American consumers at 16c per pound.

LEAD.—New York, $4.70; St. Louis, $4.70; San Francisco, $4.90; pipe 7½, sheet 8¾, bar 6½c. London, Soft Spanish Lead, £16 10s=4.72c per lb.

SPELTER. — New York, $4.70; St. Louis, $4.70; San Francisco, ton lots, 6c; 100-lb lots, 6¾c.

ANTIMONY. — New York, 9½c; San Francisco, 1000-lb lots, 11c; 300 to 500 lbs., 12@14c; 100-lb lots, 15@18c.

BABBITT METAL.— San Francisco, No. 1, 10c.

IRON. — Pittsburg, American soft—pig—large lots—$25.25; Scotch, $26.50; San Francisco, bar, per lb., 3½c.

STEEL.—San Francisco, bar, 12c to 20c per lb.

QUICKSILVER. — New York, $51.75; London, £9 14s; San Francisco, local, $51.50 ℔ flask of 76½ lbs.; export, $47.50.

PLATINUM.—San Francisco, crude, $16 ℔ oz.; manufactured, $19.50@22.00

FERRO-MANGANESE. — San Francisco, ℔ ton, $30.

ZINC.—San Francisco, 6c; slab, 6½c; bar, 8c.

ASSAY LITHARGE.—San Francisco, 10c ℔ lb.

TIN.—New York, pig, $32.50; San Francisco, $34.50; bar tin, ℔ lb, 40c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 40c to 50c.

NICKEL.—New York, 40@45c ℔ lb.

BISMUTH.—New York, ℔ lb., $1.80 50-lb lots; San Francisco, $2.50 to $3 lb lots.

CANDLES.—Granite 6s, 16 oz., 40s., 12c ℔ set; 14 oz., 40s., 11c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

FUSE.—Triple tape, $4.35 per 1000 feet; double tape, $3.70; single tape, $3.45; Hemp, $2.55; Cement No. 2, $3.70; Cement No. 1, $2.95.

WANTED.

A Rich Placer proposition, adapted to working by Steam shovel method. Description to receive attention must be accompanied by reliable reports and references.

SITUATIONS WANTED.

BY MINING ENGINEER,

who can produce first-class testimonials and good local references, position as superintendent or assistant. Highly scientific and thoroughly practical. Ten years' practical experience and management in Australia, New Zealand and America and northern placer country. First-class assayer and underground surveyor. Address L. H. D., this office.

By a Practical Miner who is thorough and up to date in working a mine. Can handle men to advantage. Understands milling, concent ating and the erection of all kinds of mining and milling machinery. With some years of experience. Will accept a position to manage a mine or mill. First-class testimonials furnished as to abilities, int grity, etc. Address QUARTZ, care Mining and Scientific Press.

Mining Engineer and Metallurgist, technically educated, with fifteen years of practical experience, is open for a new engagement as expert or superintendent. Specialty the treatment of rebellious silver and gold ores. Experienced in designing, building and running reduction works. Speaks and writes Spanish fluently. Address ALPHONSE BENO, P. O. Box 814, City of Mexico.

Competent Engineer Wants Position

to take charge of machinery, or to run hoist, or mill engine, or steam pump. Twenty-five years' experience in Wales and the United States. R. BLACKWELL, Grass Valley, Nevada Co., Cal.

Wanted—A Position as Superintendent

in a hydraulic mine by a miner who has had twenty years' experience. Best of references as to ability, honesty and sobriety. Address S. O. G., care of Mining and Scientific Press.

Metallurgist and Chemist, technical graduate, fifteen years' practical experience in Mexico and the United States, familiar with the treatment of gold, silver, copper and lead ores, desires engagement. Address METALLURGIST, this office.

WANTED.—By a Practical Miner and MINING BUSINESS Man, Position as Manager or Superintendent. Speak some Spanish. Would leave the United States if necessary. Good references. Address SUPERINTENDENT, this office.

WANTED.

WANTED.—A Second-Hand White Howell Roaster, also a Revolving Drier.

Must be in good repair. Address ARTHUR HENDEY, Agent, Copper Chief Mining Company, Jerome, Arizona.

Wanted, $1000 Cash

to construct a machine and join in securing patent and placing on the market. Just the thing for Cape Nome beach sands. Adapted to follow diggings, pumping, dredgings. Cheaply handled. Float and fine gold recovered. Magnetic iron instantly removed. New and successful application. Don't apply unless have cash to invest. Capacity 15 tons per hour. E.W. KEELER, 712 Sutter St., S. F.

WANTED.

PARTY TO DEVELOP A COPPER PROSPECT,

ONLY FIVE MILES FROM RAILROAD.

138-foot shaft. Several tons of ore on the dump. High-grade rock. Address G. F. CLARK, Tempe, A. T., care of I. S. Watrous.

Quicksilver

For Sale in Lots to Suit.

REDINGTON & COMPANY, Wholesale Druggists, 23-25-27 Second Street, San Francisco.

M. S. HAUSER,

Room 39, 3 California St., San Francisco, Cal.

Will act as purchasing agent for mining companies.
Will use the benefit of his wide experience in getting the best articles at the lowest prices, securing low freight rates, and prompt delivery.
Will submit estimates on all kinds of supplies.
Will work for either a small salary or a commission, and show a saving greatly in excess of charges.

NOTICE OF STOCKHOLDERS' MEETING.

A Special Meeting of the Stockholders of the Mammoth-Garfield Gold Mining Company, for the purpose of discussing and taking action on a proposition by the Board of Directors to sell a portion of the company's millsite in Shasta County, California, and also to subscribe on behalf of the company for certain shares of the capital stock of the Alta Sierra Gold Mining Company of California, and to transact such other business as will be brought before the meeting, will be held at the office of the company, Rooms 50 and 54, No. 120 Sutter St., San Francisco, California, at 2 P. M. on Monday, March 19, 1900.

By order of the Board of Directors.

SAM. W. CHEYNEY, Secretary.

February 28, 1900.

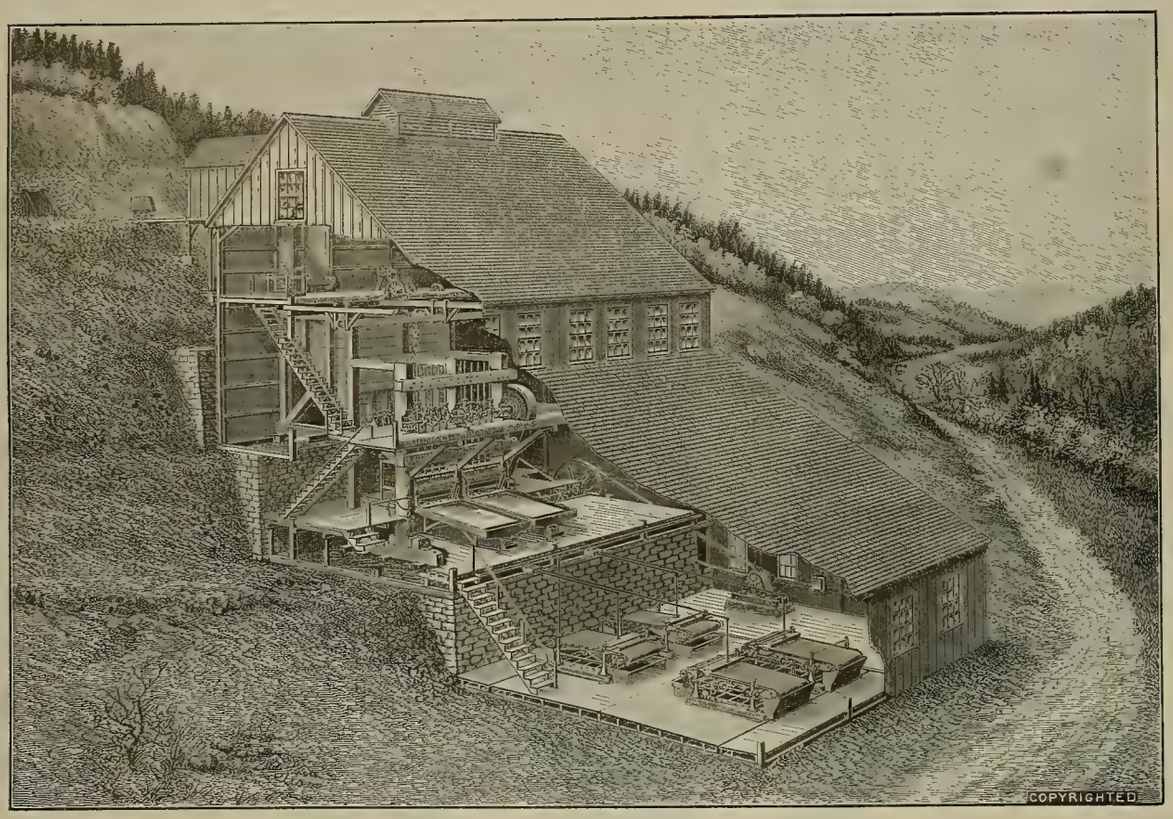
For Testing Placer Ground.

Sinks and drives 6, 8 or 10-inch pipe through boulders; takes all the loose material out, including gold, as the hole is sunk. Does the work at a very small cost. Drills water and oil wells and mineral test wells through any kind of rock to 1500 feet. Several sizes. Unexcelled for lead and zinc testing.
KEYSTONE DRILLER CO., Beaver Falls, Pa.



SMOOTH-ON CASTINGS.

An iron cement in powdered form, for repairing leaks or fractures in steam or hydraulic work, applied by mixing with water; hardens quickly and expands in hardening. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

Which use either MANUFACTURED or NATURAL GAS, ORDINARY STOVE GASOLINE (NAPHTHA or BENZINE), DISTILLATE or KEROSENE.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

Office, 314 Howard Street, San Francisco, Cal.

THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

Bradley Pulverizer Co., Boston, Mass.

THE : CAMMETT : CONCENTRATOR.
Designed with some Regard for the Laws of Concentration.

We have reports from mills employing Cammett concentrators for the treatment of ores containing galena, iron sulphide and zinc blende, that they are regularly producing on each table three distinct concentrates—one of galena, one of iron sulphide and one of zinc blende, each of which is commercially clean.

Practical experience with the Cammett concentrator proves that it **saves** and **delivers** into the **concentrates box** slimes so fine that to prevent them from being lost from the **concentrates box** it is necessary to provide several additional overflow tanks.

Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

GATES FINE CRUSHER.

The result of ten years' solid work. Success at last. What we wanted, and the public demanded, was a Gates Gyratory Rock and Ore Breaker (always adjustable and indestructible) so modified in design as to make one-half-inch product from three-inch sizes, rapidly and cheaply. The H. Fine Crusher will do this work. It takes the place of expensive big rolls and often prepares ore, without further crushing, fine enough for coarse concentration or cyaniding. In any event, it is the greatest and best intermediate machine between the coarse breaker and the pulverizer.

Ask for No. 1 Catalogue. :: GATES IRON WORKS, Dept. UU, 650 Elston Ave., CHICAGO.

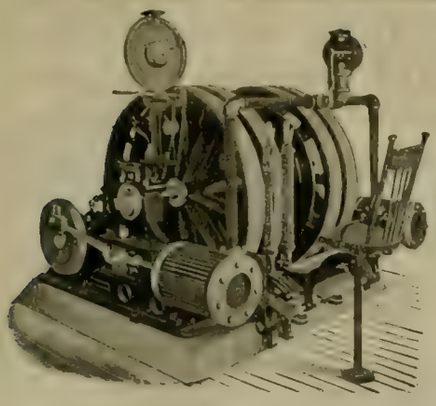
WOODBURY'S IMPERIAL CONCENTRATING TABLE.

THE Imperial Concentrating and Amalgamating Table is the latest invention of Mr. Geo. E. Woodbury, whose fame as one of the pioneer concentrator builders is world wide, machines of his manufacture being in general use in every country on the globe where the milling of ores is carried on. This Table is, however, built on entirely new lines, differing materially from either the well-known belt or bumping table types of concentrators.

SIMPLE IN ITS CONSTRUCTION.

SAVES FINE SULPHURETS.

WITHOUT LOSS IN TAILINGS.



MAKES HIGH PRODUCT.

CAPACITY FROM 5 TO 10 STAMPS.

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work. Easy adjustment. Little wear.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

—— SEND FOR CIRCULARS. ——

No. 1 Special Button Balance with 5-inch beam. Sensibility 1-200 Milligramme. Made for particularly accurate and rapid work and is guaranteed to be the finest balance on the market. It is the balance used by Prof. Forsythe of the Lawrence Scientific School, Harvard University, for scientific research. Send for Catalogue A, illustrating and describing a full line of assay and analytical balances, to

All of our latest improvements are embodied in this instrument and it is the result of our 18 years' experience in building balances.
Among the noteworthy features in the make-up of this balance is the improved adjusting device, herewith shown.

The adjusting device will appeal to the assayer as the simplest and most convenient means of checking the beam, and consists of a star wheel on a threaded arbor, mounted on the center edge back of the beam.
By turning this wheel backward or forward, it is moved along the arbor and so adjusts the beam to equilibrium.

Wm. Ainsworth & Sons,
(Successors to WM. AINSWORTH.) DENVER, COLO., U. S. A.

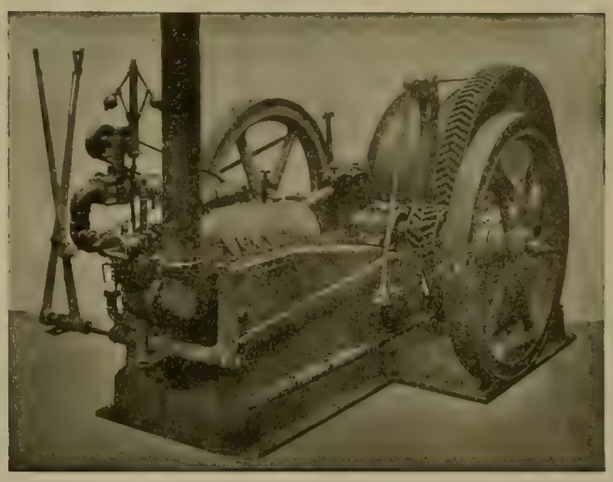
Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

DEWEY, STRONG & CO'S PATENT AGENCY.

330 Market Street, San Francisco, Cal

Why Detroit Lubricators Should Be Preferred.

In addition to their many other good qualities, the Detroit Lubricators are made extra strong and heavy, each one being tested at a pressure of 300 lbs. to the square inch before it is allowed to leave the factory. This is probably twice as high a pressure as they will ever have to work under, so they are very durable and longlived, and, unless injured by accident, will not require any repairs for years. For this reason, they are particularly well adapted to users in the Rocky Mountain district and on the Pacific Coast, where it is expensive and inconvenient to get repairs. Our catalogue showing our different styles of sight feed lubricators, glass and brass oilers, oil pumps, oiling devices, etc., will be sent on application.



DETROIT LUBRICATOR CO., DETROIT, MICH.

MINE BELL SIGNALS. Adopted, Used and in Force in Accordance with Law.

We print in legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act passed by the California Legislature. The law is entitled "An Act to Establish a Uniform System of Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness. 50 Cents a Copy.

No. 2070. — VOLUME LXXX. Number 10. SAN FRANCISCO, SATURDAY, MARCH 10, 1900. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Hydraulic Mining in California.

About 70% of the $1,350,000,000 of California's gold yield to date has been from the placer mines, this sufficiently illustrating the magnitude of operations. Herewith appear some typical views of California hydraulic mining as it has been carried on: the old familiar giant, from which the solid stream issuing with tremendous force tears down the hillside. In its day the North Bloomfield, in Nevada Co., was the most extensive hydraulic mine in the world, and handled the material at a less cost per cubic yard of any of which authentic record is kept. In one year the North Bloomfield Mining Company washed 1,591,730 cubic yards of top gravel, which yielded three and eight-tenths cents per cubic yard. During the same period the company washed 702,200 cubic yards of bottom gravel, which yielded thirty-two and nine-tenths cents per cubic yard. The bottom gravel extended up from the bedrock 65 feet vertically. All above that to the surface was considered top gravel, varying in depth from 10 to 200 feet. All this was handled at a cost of less than two cents per ton.

North Bloomfield Hydraulic Mine, Nevada Co., Cal.

It was in Nevada Co. that this form of American mining had its origin, and at one time its greatest development. In Nevada Co., also, the first quartz-mining district in this country was organized and the first mining district laws regulating such mining were there adopted. At Dutch Flat, Placer Co., the Polar Star has a pipe line that carries 2000 inches of water. The district in which the Polar Star is operated has produced $20,000,000 in gold, and is still profitably productive.

The hydraulic mines in the northern part of the State go on unvexed by debris law restriction, and great sums are invested in pipe lines that in some places cross rivers on the principle of the inverted siphon. One across the Trinity river at Junction City, Trinity Co., has a 350-foot span, carries 3000 inches under 500-foot head, the cables upholding the supports being 620 feet long, 5 inches diameter, and weighing eleven tons each. At that point the La Grange mine, now considered the largest of the kind in the world, has a ditch that carries 9000 inches of water, a 30-inch steel pipe line ½-inch thick, 4850 feet in length, with a pressure of 450 pounds to the square inch. From where the water is forced across the stream, it is carried one and a half miles in a flume and thence through a mountain tunnel 8390 feet long, being again carried four miles through another flume. Here, as elsewhere, French capital has found profitable investment.

Polar Star Hydraulic Mine, Dutch Flat, Placer Co., Cal.

The water systems of California hydraulic mines such as here typified cost great sums of money. The Park Canal & M. Co. spent $2,000,000 on its plant; the North Bloomfield M. Co. similarly spent nearly $750,000; the Spring Valley & Cherokee in Butte Co., $500,000; the Phœnix Ditch Co., $880,000; the Smartsville, Yuba Co., ditch system, $1,000,000; the El Dorado Water & Deep Gravel M. Co., $600,000; the La Grange D. & M. Co., noted above, $450,000; and a host of others of equal magnitude, aggregating probably $100,000,000 invested in the greatest system of the kind ever devised.

This is but one kind of California hydraulic mining; drift mining is of equal importance to the surface work here so briefly noted, and, of late years, the system of gold dredging, now receiving such deserved attention.

Patents for Pacific Coast Inventors; Notices of Recent Patents; Recently Declared Mining Dividends; Commercial Paragraphs; Books Received, 267-268.

THE attention of mining men everywhere is respectfully directed to the fact that this paper publishes each year a greater amount of original matter from men who are engaged practically in doing the things they write about than any other journal in the United States. This paper is the recognized medium of exchange of such practical information, furnishing helpful hints and practical points in mining and metallurgy written by men who from daily practical experience know just what they are talking about.

IN COMMON with others, Utah miners object to the recent ruling of the U. S. General Land Office, which requires that where the locator is trying to develop a group of claims by sinking a single shaft, he must do $500 worth of work on each claim before he can get a patent for them. It was held by the land office some time ago that there must be an aggregate amount of work done on a group representing $500 for each claim; that is, in the case of a man owning five claims, he would have to do $2500 in work—$500 for each claim—but could do all the work on one claim—before patent could issue. Now the land office goes further, and rules that while this may do in case of a tunnel, it will not suffice where a shaft is sunk, but that in such case $500 worth of work must be done on (not for) each claim. This is a singular distinction and bears hard and unjustly on a good many who have been trying to comply with all the new rules of the land office as fast as they are issued. It is such arbitrary rulings that furnish one of the best answers to the question even now occasionally heard: "What do the miners want of an executive department of mines and mining?"

The Value of Trade Catalogues.

The handsome catalogues issued by mining machinery manufacturers are worthy of continuous attention. They usually represent up-to-date devices explained and illustrated in a manner that makes their construction a matter of interesting information to any one who has anything to do with their use. While, of course, they are intended to secure sales of such goods, they also serve as current information of great value to miners, metallurgists and mining engineers. They represent the state of the art and the farthest present progress in such manufacture; they call the attention of every man who uses such things to details and improvements that are of great importance to intelligent workers. They add to and supplement the regular announcements of these manufacturers as found in our advertising columns, and are to be considered in connection therewith. A manufacturer can not always secure the space requisite to fully illustrate and describe his machinery, but in his catalogue he can elaborate and furnish the very information of immediate value to men needing precisely that particular device. The advertisements tell where machinery can be had. The catalogues supply extended and exact information about such machinery. These catalogues are also much more than the mere term "catalogue" would imply. They are really trade treatises, technical descriptions, valuable brochures of reliable information on the subjects they discuss. Many a "catalogue" received from a mining machinery manufacturer contains more information of real value to the miner than the contents of a poorly edited "mining journal" or other similar publication. Some of the foremost miners and mining engineers in the country have the commendable habit of procuring and filing for reference the catalogues of prominent mining machinery manufacturers, and in this way secure in fine form a vast and varied amount of technical data that is of daily value in their work.

Mining and Scientific Education.

After all, is it not becoming very clear that every line of mining and scientific advancement must proceed from wider knowledge and fuller understanding? Does not not every real reform in the condition of the miner, metallurgist or mining engineer, both in his own productive activity and in his relations with other activities and interests, depend for its realization upon more accurate knowledge and better trained reasoning and perception? Is it not a wonder, in view of what some miners do not fully and accurately know about their materials, conditions and environment, that they succeed at all? Of course these questions could as reasonably be asked about people in other callings and professions, but we are not dealing with them nor suggesting any comparisons with them. Their deficiencies do not atone for ours, though they undoubtedly make ours more tolerable—but that is another question.

The more that is accomplished in mining and scientific progress—and certainly there is much—makes it plainer that though there is no royal road to knowledge there is a kingly path away from it, leading toward all points of advancement. All the short cuts toward the elevation of the miner, socially, financially and politically, have yielded only disappointment and, too often, discouragement also. There have been efforts enough of this kind to show that, briefly speaking, it is learning that is needed rather than legislation: it is perception rather than political influence: it is wisdom which will win all that is desirable both in laws and positions, when all other preparations fail to attain them.

American experience during the last quarter of a century has furnished ample demonstration of the results of close investigation and hard thinking. Industries have been built up here with new materials, under new conditions, and the promoters have largely wrought out the opportunity and the demand which have made them profitable. Our miners have developed new and characteristic processes and something like eight hundred millions annual output to the State is the present measure of accomplishment. All this is the reward of wisdom. It is not the outcome of mere knowledge, because the knowledge itself had to be developed step by step as each line of mastery became essential to further progress. It is the work of the creative function of the human mind, which is inexpressibly higher than any accomplishment of the receptive faculties, which are its servants. It discloses the ability to see clearly and truly and to think logically and perseveringly. It is a triumph of education, and its testimony is valuable to us and to the world.

Our own industrial accomplishments are emphatic illustrations of the truth which the world is now coming to recognize as never before. Of course, the world's leaders have always known and enjoined it upon the people. It was left to this country as a priceless legacy from its foundation, for when Washington charged his followers to "educate the masses," he invoked the only agency by which the permanency of the republic could be secured. It is of universal application. The recognition of its applicability to mining progress has been deferred, but is now wide and clear. Mining education is now popular. Every mining school displays this fact in increased attendance and enlarged facilities; every intelligent and sincere mining publication feels the warmth of popular patronage and support; every educator of breadth and insight sees that the common schools must provide effectively and earnestly for training of the young along lines which minister to elevation and which promote appreciation of the opportunities in mining and scientific progress. There are now discernible a spirit and a purpose in these matters which are new with this generation.

Such education is accepted now as a statesmanlike effort. During the last two decades special commissions in all civilized countries, charged to inquire into industrial conditions, have reached the same conclusions, viz., that while legislative reforms are essential, and they naturally differ in different nations, there is an underlying principle which is the same in all of them, and that is that the advancement of any class, in their own arts and in their relations to other elements of population, must be chiefly attained by systematic and liberal provision for education. That this is the universal need and its demonstration, as the result of the fullest investigation and the ripest thought of those who can see most deeply into existing conditions, is indisputable. So important is the matter that it is no longer a plea for the miner in his own behalf; it is a demand by statesmen in the interest of national strength and progress. The miner need no longer feel that he is a clod by the roadside along which national pageants pursue their courses. He is borne aloft as the holder of the key of the world's well being. The victories of peace and war, the achievements of commerce, are largely dependent upon his success; in fact, the whole fabric of civilization must be woven from the materials which he must supply by acts of higher intelligence than have ever been hitherto required.

A Standard Ohm.

Should an International Congress of Electrical Engineers be held during the coming Paris Exposition, it is to be hoped that steps will be taken to standardize the ohm, i. e., to adopt some one standard unit of resistance. We have a standard volt and a standard ampere, and why should we not have a standard ohm for theoretical, if not necessarily for practical, exactness in the electrical field? Instead, there are in existence to-day four standards for the unit of resistance, viz.: The "legal" ohm, the "international" ohm, the "British Association" or "B. A." ohm and the "Siemen's" ohm.

The "legal" ohm was adopted by the International Congress of Electrical Engineers held in Paris in the year 1884. As adopted, the "legal" ohm was made equal to the resistance offered to flow of electricity (unit flow under unit pressure) by a column of mercury one square millimeter (0.03937 inch, or a small fraction less than $\frac{1}{25}$ inch) in section and 106 centimeters (0.4173+ inch) in length, the temperature being at the freezing point (32° F. or 0° C.) and the pressure of the air being equal to the pressure at the base of a column of mercury 760 millimeters (30 inches) in height. The "international" ohm was adopted by the International Congress of Electrical Engineers, held during the World's Fair at Chicago in the year 1893. The unit adopted was the same in every respect as the "legal" ohm, except that the length of the mercury column was changed to 106.3 centimeters (0.4185+ inch). This unit is not generally used, however. The "British Association" or "B. A." ohm was determined at London in the year 1863 by a committee appointed by the Association upon the same basis as that upon which the "legal" ohm was afterwards calculated or determined, i. e., upon what is called the C. G. S. (Centimeter Gramme Second) system—in fact, the Paris unit is really a correction of the "B. A." unit. The latter is smaller than the "legal" ohm, the actual proportion being 0.986 to 1.0.

The "B. A." unit is largely used in Great Britain. The "Siemen's" ohm is equal to the resistance offered to flow of electricity (unit flow under unit pressure) by a column of mercury 100 centimeters (0.3937 inch) long, the other details as to size, temperature and pressure being the same as those used in determining the "legal" ohm. The "Siemen's" ohm is largely used throughout Europe. The only thing necessary in the adoption of a standard ohm would be to fix upon some uniform and universal standard of length for the mercury column—a present necessity for international convenience.

Concentrates.

NO INSULATOR of magnetism is known.

AN explosion of gasoline gas mixed with ten parts of air will give an initial pressure of 150 pounds per square inch.

WITH a 125-foot head a nozzle 4 inches in diameter will discharge 7.28 cubic feet of water, 364 miner's inches, per second.

ANY galvanometer, having a resistance which is large in proportion to the current to be measured, can be used as a voltmeter after calibration.

TO FIND the approximate number of gallons of water raised by a pump per minute at 100 feet piston speed—square the diameter of water cylinder and multiply that by 3½.

DRY STEAM is obtained by such construction of the boiler that steam alone shall rise above the water surface without carrying up with it any of the water from which it is generated.

THE density of air in a shaft or depression four miles below sea level would be equal to that of water. There a cubic foot of air would be just the same weight as a cubic foot of water.

THE strength of the solution in each cell of storage battery should be tested with a hydrometer once a month. When the battery is fully charged, it should indicate 22° Baume.

ALUMINUM has the least electrical resistance for a given length and weight and mercury has the greatest; but for a given length and sectional area, annealed silver has the least resistance and bismuth the greatest.

IN laying out the holes in a belt for the lacing, do not get them too near together, for while this practise makes the finished lacing stronger, it makes the belt weaker, on account of the large amount of material cut away in making the holes.

AN Amador county, Cal., mining superintendent, sending $12 and the names of four of his colleagues to whom he wishes to have this paper sent for a year, says: "We in this section appreciate your paper very much, and look to it as authority and a publication of solid worth, deserving the support of any one engaged anywhere in the mining and milling of ores."

A "HEAT UNIT" means the measure of heat required to raise the temperature of one pound of water 1°. The latent heat of water is equal to 143 units of heat; that is, it requires one pound of nearly boiling water to melt a pound of ice, and then the pound of water from the ice will conceal or hide the extra heat, and, at the end, the two pounds of water will be at 32° F. the temperature of ice.

J. K. HARDY of Chicago, Ill., rises to say that he has spent most of his life in the study of metallurgy, and that he has discovered a process by which he produces from lead a metal that has all the chemical and mechanical qualities of tin. Incidentally, he also makes a product of copper, so hard that it may be used in car journals. He and "Argentaurum" would make a good combination.

ONE pound good coal evaporates six to eight pounds water (average boiler); two and one-quarter pounds dry wood are equivalent to one pound good coal; one cord of wood, 128 cubic feet, contains 72 cubic feet solid wood; weight of dry pine (Pacific coast), per cubic foot, about thirty pounds; 1970 pounds Scotch Splint coal are equivalent to 2250 pounds Wellington coal, or 2500 to 3000 pounds California coal.

A BAROMETRIC READING of 20.9 inches indicates, approximately, an altitude of 10,030 feet above sea level and an atmospheric pressure per square inch of 10.26 pounds. The height of the barometer in inches multiplied by .4908 equals the atmospheric pressure in pounds per square inch. The barometer showing 22.2 inches indicates, approximately, an altitude of 8350 feet and an atmospheric pressure of 10.9 pounds per square inch.

ON an inclined plane the strain on a hoisting rope with a load of 2000 pounds varies, of course, with the elevation. With an inclination of 40 feet in 100 feet the angle of inclination would be 21° 50′, and 2000 pounds on the rope would produce a strain of 735 pounds. At that inclination a load of 3500 pounds, including weight of rope, would induce a strain of $\frac{735\times3500}{2000} = 1286.25$ pounds.

IN Colorado the origin of placer gold is ascribed to glaciers that mined the gold-bearing rocks on a gigantic scale, carrying the debris into the canyons and dumping it in their moraines along the sides, where, subsequently, floods and streams sorted and rearranged those piles, the gold being distributed through the mass of material by gravity, finding its way down to bedrock. In South Park paying placer ground is found 10,000 feet above the sea.

PURE iron is almost white in color. Pure uranium is even whiter than iron. It can be filed with ease, and does not scratch glass. It is made yellow by the presence of nitrogen. It is not magnetic and is more volatile in the electric furnace than iron. In a state of powder it burns in fluorine, forming a green fluoride. It burns in oxygen at a temperature of 170° C., combines with nitrogen at 1000° C., and decomposes ammonia at a red heat.

HISTORY furnishes records of the working of the copper mines of Sinai from about 5000 B. C. to 1200 B. C. These possessions brought on several bloody wars. The scepter of Pepi II, of the sixth Dynasty, is preserved in the British Museum. The entrance, the ruins of the furnace, the crucibles, the huts of the miners, and some fragments of tools still exist. In the debris have been found remains of furnaces and crucibles, slag and cinders.

AS BETWEEN tunneling and sinking to strike the vein, the advantage, ordinarily, lies with tunneling. The tunnel is self-draining; it needs no hoisting machinery; the cost per foot is less; timbering is easier provided for. Where the enterprise is not on an unusually large scale, and the distance is not over 3 feet of tunnel to 1 foot of shaft sunk, the tunnel is deemed preferable. Of course, special circumstances govern every case and no general rule can apply.

ZINC-POTASSIC CYANIDE is a solvent of gold, but of a lesser power than potassic cyanide alone. It is not decomposed by alkali into free potassium cyanide and potassium zincate. In presence of potassium cyanide it can have no solvent action on gold, and consequently is valueless in the ordinary cyanide process. A test with silver nitrate in presence of potassic hydrate does not show the cyanide available as a solvent of gold, but the total amount of cyanogen in the solution.

TO AMALGAMATE a new copper plate many miners first rub it with extremely fine brick-dust, or very finely sifted wood ashes, then rubbing it briskly with a woolen rag dipped in dilute nitric acid—one part acid, nine parts water—until thoroughly polished, then repeatedly washed in clear water. A solution of cyanide of potassium may then be applied, after which prepared quicksilver is put on until the entire surface of the plate is thoroughly coated and is bright, soft and sensitive to the touch.

ACETYLENE GAS is a combination of hydrogen and carbon, and is the product of the decomposition of calcic carbide and water. Calcic carbide is the combination of calcium and carbon and is a product resulting from the action of the heat of the electric arc on lime and coke. A short ton of calcic carbide, 95% pure, may be counted on to produce 10,000 cubic feet of illuminating gas with tenfold the brightness of ordinary illuminating gas. San Francisco gas costs the company 48 cents per 1000 cubic feet.

A COLUMN of water having at its base a pressure of 400 pounds to the square inch, gives the same aggregate force as another column of water where the pressure is 204 and the area 49. A column of water 5 inches in diameter and 921 feet high is equivalent in total pressure to a column 7 inches in diameter and 469 feet high. The principle of pumping by hydraulic power is the transmission of the pressure of water from a high level to a pump motor at a lower point for the purpose of raising a larger quantity of water against a less pressure.

THE square of the velocity of the wind in miles per hour, divided by 200, gives the force of the wind in pounds per square foot. To have a man and a parachute weighing 300 pounds alight with a uniform velocity of 16 feet per second, the parachute should be 25.1 feet diameter—(16 feet per second is 11 miles per hour: $\frac{11^2}{200} = \frac{121}{200} =$ .605 pound pressure per square foot; $300 \div .605 = 495.86$ square feet. That is "square feet;" the parachute being circular, $\frac{495.86}{7854} = 631.35$ area in "circular feet;" $\sqrt{631.85} = 25.1$ feet, diameter of parachute).

TO DETERMINE the horse power necessary to drive a given number of stamps in a battery, one way is to multiply the number of stamps by the weight of each, and this product by the number of drops per minute, and again multiply this last product by the number of inches space through which the stamps are to drop; this last product is then to be divided by 12, and that quotient by 33,000. The last quotient should give the horse power—theoretical—required. Example: with ten stamps, weighing 950 pounds each, dropping 100 times per minute through 6 inches space, $10\times950\times100\times6\div12=475,000\div33,000=14.4$ H. P. It would be safe to add 25%, which would make required horse power about 18.

SANDSTONE has a singular effect on drill bits. Though sandstones are usually soft, the bits cannot be finely pointed, but, on the contrary, should be flattened. A bit with a knife-edge when used in sandstone will have its edge sharpened like a razor, the faces of the bit gradually becoming concave. This is natural, because, as the bit imbeds itself in the grit of the rock, it is rubbed as though on a grindstone. The stone is not usually hard enough to dull the sharp line of the edge, so that the more this bit is used the sharper it gets. It can not, however, be used very long, because the point or outside ends of the bit become flattened and dulled, and, what is a still greater objection, the ends become tapered. All this arises from the hard work and the great rubbing experienced at the walls of the hole.

ONE gallon of gasoline produces from 60 to 80 cubic feet of vapor, according to the temperature and density of gasoline. From five to six volumes of air per volume of vapor is used, and even twelve volumes is claimed as the most economical mixture of air with gasoline vapor for explosive power effect. The explosive pressure varies with the ratio of mixture of air and vapor, and also with the ratio of charge volume to the volume of the cylinder; in practise it varies from 90 to 150 pounds per square inch. Compression, as in the four-cycle engine, adds its own pressure to the explosive effect and increases the mean piston pressure in a large degree. The theoretical pressure is somewhat greater than the actual pressure, owing to the uncertainty of perfect mixture in the gases and undefined limit of absorption of heat in the cylinder walls.

THE barrel used in the modern chlorination process consists of a heavy plate steel shell, with cast iron heads, provided with trunnions, on which the barrel slowly revolves. To one of these heads is bolted a spur gear, driven by a pinion carried by a countershaft, which in turn is driven either by friction gearing direct from line shaft, by belt and friction clutch pulleys, or by slack belt and tightener. A brake stops the barrel at any desired point. The barrel has two manholes with covers for charging, suitable inlet and outlet pipes and valves for the solution. It is lined with chemical sheet lead, and has an internal filtering diaphragm. The filter consists of a sheet of perforated lead, supported on wooden segments, covered with a sheet of asbestos cloth and the cloth with a wooden grating, the whole being held in place by wood cross beams. A five-ton barrel is 62 inches diameter, 8½ feet long, and weighs about 20,000 pounds.

THE Bessemerization of copper matte spoken of in last week's issue in the account of the California Copper Co. at Madera, Cal., applies the principle of the Bessemer converter to the desulphurization of copper matte. The process depends, primarily, upon the production of its own heat by the combustion of those ingredients of the matte which it is intended to eliminate, principally sulphur and iron. The oxidized sulphur escapes as sulphur dioxide. The oxide of iron formed must be provided with silica to form a fusible slag. The kettle or converter in which the operation is conducted is lined with a siliceous material, which is rapidly corroded by the fluxing action of the oxide of iron. After a limited number of charges have been blown in one kettle it must be removed for repair, and be replaced by another. A converter holding one ton of matte, if it contain 50% copper, may be blown into copper in an hour. A low pressure blast is used successfully. The Copper Queen, Arizona, affords a good example of practical work of this nature. Where such Bessemerizing plants as those at the Copper Queen or Anaconda, Montana, are in operation, a change in methods has been suggested, viz., arrest the Bessemerization when the molten regulus has reached the white metal pitch, say at 75% copper, for up to that pitch no loss of valuable metals takes place, crush this white metal, calcine a portion, mix with raw, and charge the mixture into a refinery furnace to make refined copper, instead of continuing the blowing upon the metal in the converter until it comes to copper, and charging this copper into the refinery furnace to make refined copper.

CONCERNING damages in case of such disaster as that resulting so fatally at the Mountain Copper Co.'s property in Shasta county, Cal., on the 1st inst., nothing is at present to be said. In the case of Finlayson vs. Utica M. & M. Co., 67 Federal Reporter, 507, in the 8th U. S. Circuit Court of Appeals, the "rule of safe place" was thus laid down: "The doctrine that a mining company can send its employes into the bowels of the earth to conduct the mining operations, without making any provision for the proper supervision and inspection of the mine for the security and protection of the miners and the mine, is unsupported by authority, is opposed to sound public policy, and is cruel and inhuman. Miners do undoubtedly take upon themselves all the ordinary and usual risks of the business. These ordinary risks are the risks incident to the business when it is conducted by the mine owner according to the customary and approved methods and with due regard to the safety of the miners. The neglect of the mine owner to discharge his duty in this regard is not one of the risks assumed by the miner, but is a negligent act on the part of the mine owner which renders him liable to damages to any miner injured thereby. It is the duty of the mine owner to provide a competent foreman or inspector to superintend the working of the mine; it is the duty of this foreman to direct the miners when and where to work; and it is particularly his duty to make timely inspection of the timbers and walls and roof of the mine in order that no harm may come to the miners from causes which a capable and diligent inspector would discover, and, when discovered, remove or cause to be removed. Where blasts are used in a mine, it is the imperative duty of the foreman to be diligent in discovering the effect of the blast upon the timbers, walls and roof of the mine, and to point out to the miners any dangerous conditions resulting from the blast, and to cause these conditions to be removed without delay, by proper appliances and with as little danger to the men as practicable. Mining is a necessary and permanent business, and must be conducted in an intelligent, orderly and systematic manner, not alone for the protection of the miners, but for the preservation of the mine itself. For these reasons, the business must have an intelligent and competent head. The necessity for this is imperative. When properly conducted, there is no pursuit in the country carried on with greater regularity, system and order, and with a stricter observance of rules intended to secure employes against accident and property from loss or damage. The conditions confronting the miners from day to day, as a rule are neither unexpected nor unusual. They are the common and expected incidents of mining, and, when the foreman does his duty, they are provided for and met without accident or any special danger. There is nothing hasty or haphazard about the business."

Notes on Ore Dressing.

NUMBER II.*

Written for the MINING AND SCIENTIFIC PRESS by A. W. WARWICK.

CRUSHING.—The crushing of an ore, as a preliminary to the separation of its constituent minerals, should be conducted in such a manner that each mineral may be detached from any other adhering or enclosing mineral or rock; the minerals, however, should not be broken down to any finer size than is absolutely necessary. An ideal crushing plant would set loose each mineral from any other and yet each would retain its original size and shape. The nature of the material to be treated will, however, not allow even a close approximation to this ideal.

The machinery used to effect the crushing may conveniently be divided into the following classes:

1. Coarse crushing: (a) stone breakers of reciprocating type, e. g., Blake's crusher; (b) stone breakers of gyratory type, such as Gates and Comet; (c) rolls.

2. Fine crushing: (a) high speed, belted rolls; (b) gravitation and steam stamps; (c) horizontal roller mills, such as Huntington and Griffin mills.

It need hardly be pointed out that these machines are seldom used alone. Generally two or more are used in combination, and in this connection it may be said that the arrangement is fully as important as the choice of the machines. The crushing department of the average mill is the one most open to criticism, and there is no doubt that the greatest cause of avoidable losses is to be found in the excessive crushing. The arrangement usually adopted is much as follows:

1. The ore is dumped over a grizzly with say 1½-inch spaces.

2. All stuff too coarse to go through the bars is crushed by a Blake to 2-inch cubes.

3. The fines from the grizzly and the product from the rock breaker are crushed together in a set of rolls.

4. The product from the rolls is screened to the desired size; the fines are passed on for treatment and the coarse is

5. Either returned to the rolls or goes to a second set.

The general result of this treatment is to obtain a mixture, a portion of which is of the size desired, but most of it finer than is necessary. A good deal is so fine that it is exceedingly difficult to save the values. The tendency is, however, to give more consideration to the question of crushing. It is becoming more generally recognized that it is absurd to break mineral down to a fine powder and then to introduce machinery to save it.

Two general principles may be laid down: (1) The best system of crushing is the one that produces the smallest amount of stuff finer than is desired; (2) each ore requires a different mode of treatment, sometimes radically different and sometimes differing only in detail.

Before considering the machines, the character of the work to be done may well be investigated, thus following out the old precept of being able to arrange and choose the machinery to the ore, instead of vice versa.

From the point of view of crushing, ores may be conveniently divided into four classes: (1) The minerals are coarse and easily broken apart; (2) the minerals are finely disseminated through the matrix, but the valuable minerals are not intermixed; (3) the minerals are coarse or occur as masses in the matrix, but the valuable minerals are closely associated; (4) the minerals to be saved are finely disseminated through the matrix and are also closely associated with each other.

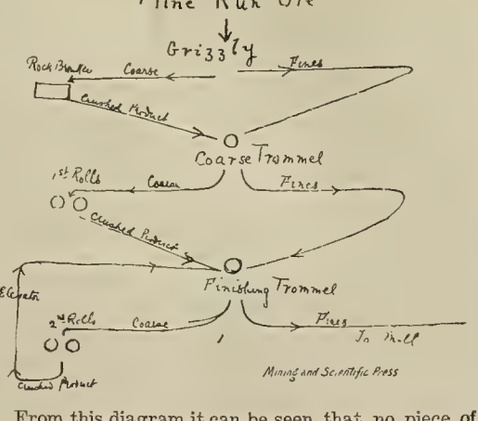
The character of the crushing required for each class is obvious. Of course, the finer the minerals and the more closely they are associated the finer the rock must be crushed to unlock them. Every case requires separate and careful consideration, and it may here be pointed out that examination of small samples is worse than useless. The ore should be examined either in place in the mine or in bulk as it is broken by the miners and as it may be sent to the mill.

Besides the coarseness, etc., of the mineral, other considerations have to be taken into account. The most important of these is the varying frangibility of the minerals. It is unfortunately the case that most of the valuable minerals are very fragile as compared with the accompanying gangues. A familiar case is quartz and galena. The minerals on going through a crushing machine are both subjected to the same treatment, with the result that the soft, fragile galena is broken up very finely as compared with the hard, tough quartz. Cases the direct opposite of this are known. The writer once examined a sandstone impregnated with native copper. Several hundred pounds were crushed to a 16-mesh screen and the product sifted successively through 25, 30, 40, 80 and 100-mesh sieves. Each product was weighed and analyzed with the following results:

	Mesh	Per ct.	Copper, per ct.
Ore between	25 and 16	14.2	18.6
Ore between	30 and 25	25.3	22.5
Ore between	40 and 30	18.6	4.2
Ore between	80 and 40	22.9	3.5
Ore between	100 and 80	10.4	3.0
Ore finer than	100	8.6	3.1
		100.0	

In this case the filaments and scales of copper were flattened out to a large extent, and by far the greatest percentage was found in the coarse material. Such cases as this are, however, rare.

This difference in frangibility of minerals is sometimes taken advantage of for their separation. At Lintorf,† Germany, a product is obtained from the jiggers composed of about half zincblende and half iron pyrites. This material was passed through a Vapart disintegrator, and by screening the crushed material an enhanced value was obtained. This machine takes advantage of centrifugal force in order to crush; a horizontal plate revolves at a high speed and the material referred to was fed to the center. The particles are hurled off the plate tangentially and strike a ring that encircles the plate at some distance from it. The impact causes the minerals to fracture, chiefly along the cleavage planes. At Lintorf it was found that when the plate made 350 revolutions per minute the zincblende only was broken, but that on increasing the speed to 800 revolutions the pyrites were broken to grains of 1½ to 1½ mms., while the blende was reduced to an impalpable powder. On screening out the fines, it was found that they contained 50% zinc. Before treatment, it was difficult to get a market for the mixed pyrites and blende even at about $2.50 per ton, but, on treating as described, 2000 pounds of material gave the following returns:



1100 lbs. pyrites containing 5% zinc, value	$2 30
900 lbs. blende, 50% zinc, value	7 75
Total value	$10 05

The cost of treatment was about 20 cents per ton.

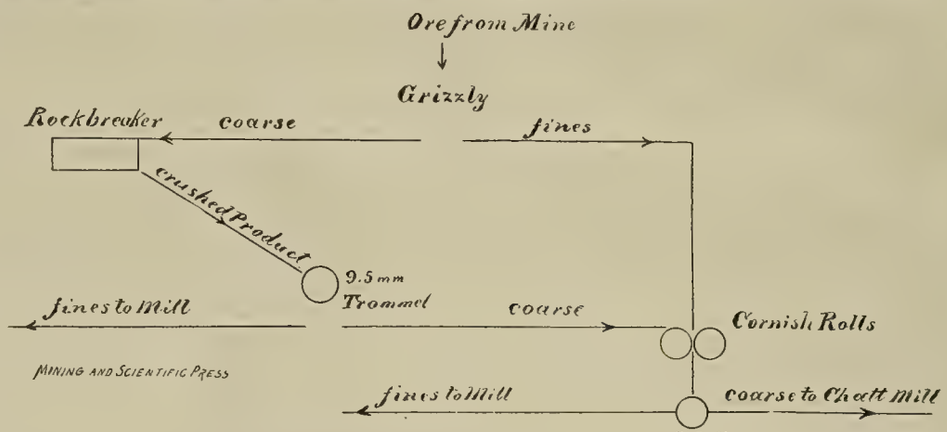
In by far the most cases the difference in frangibility works against the operations of ore dressing. The fines contain the most values, and at least 80% of the losses incurred in the entire mill incur in treating the fine stuff.

It is not important, therefore, to arrange the crushing plant with a view of decreasing the fines. The most generally adopted plan, when the question is given consideration at all, is to crush the ore in stages and to remove at each stage the product already reduced fine enough.

In carrying out this system the machinery usually adopted consists of stone breakers and rolls, although of course any suitable machine may be used. The diagram given below represents a gradual reduction process in its simplest form; of course, the stages may be multiplied, but, beyond a certain point, it may be doubted if there is any advantage to be gained.

From this diagram it can be seen that no piece of ore is crushed unnecessarily; the grizzly removes the fines from the mine ore before the latter receives its first crushing; the coarse trommel takes out the fines before the roughing rolls receive the coarsely-crushed ore, and finally the finishing trommel takes out all the ore crushed fine enough before being sent to the last set of rolls. As a result, each machine is relieved from unnecessary work, so that the output of the entire system is increased, and the amount of fines made is greatly reduced. Without considering the mechanical principles involved and the obvious advantages and disadvantages, there can be no doubt that the work done by a gradual reduction crushing plant is far better than in the system in which one crusher feeds another directly without intermediate screening.

The old system, however, still obtains to a great extent and is well exemplified by the mills at Bonne Terre, Mo., described by Munroe. In this case the ore consists of magnesian limestone carrying galena and is of easy crushing character. The screen used has 6 millimeter round holes and the finished composition:



Between 4 and 16 millimeters	2.0%
" 1 and 4 "	41.0%
" ¼ and 1 "	27.0%
Finer than ¼ millimeter	30.0%
	100.00%

In this case we see that about one-third of the ore was reduced to slimes and Munroe's paper shows the embarrassment and loss occasioned by this large proportion of slime.

Some years since, the writer inspected a mill near Hayden Bridge, Northumberland, England, that had a modified gradual reduction plant. A series of tests were made on the crushed product and a much better showing was made than that given above. The ore was crushed to a 9.5 millimeter screen and consisted of galena associated with baryta spar and limestone. The average of several sets of screenings gave the following results:

Ore between	5 mm.	and	9.5 mm.,	15.5,	percentage lead,		2.3
" "	3 "	"	5 "	28.25,	"	"	3.5
" "	1 "	"	3 "	18.75,	"	"	4.7
" "	½ "	"	1 "	25.5,	"	"	4.6
Finer than ½ mm				15.0,	"	"	7.2

The crushing plant used at this mill may be shown diagramatically as below.

The operations were:

1. The ore was screened over the grizzly with 3-inch spaces: the coarse went to a 12x8 Blake and the fines to a set of Cornish rolls.

2. The product from the rock breaker was screened in a 9.5 mm. trommel; the fines went to the washing machinery and the coarse to the Cornish rolls.

3. The stuff from the rolls was screened in a 9.5 mm. trommel; the fines going as before to the mill, while the coarse went to a special portion of the mill, known as the chatt mill, for special treatment.

As a result of this system of crushing a product was obtained amenable to the after operations. It will be noticed that this is not a perfectly arranged plant. At least 27% of the fines from the grizzly would have gone through a 9.5 mm. screen and hence this latter should have been removed.

(TO BE CONTINUED.)

INVESTIGATION of the causes, effects and means of prevention of forest fires in the West will be carried on this summer in Washington, Oregon, California, Arizona, New Mexico, Utah, Colorado, Wyoming, Montana, Idaho and South Dakota. Besides field study, designed chiefly to discover means of preventing the evil, the Division is making a historic record of all important fires which have occurred in the United States since 1754. Although yet incomplete, this indicates that the annual recorded loss by forest burnings in the United States is, at the lowest, $20,000,000. It will probably run far above this sum, as the Pacific Coast States have been only partially examined. Accounts of over 5500 disastrous fires have been obtained in the seventeen States already examined. Michigan, Minnesota and Wisconsin have suffered the most severely. These records are taken chiefly from newspapers; and where it has been pos-

*No. 1 of this article appeared in the issue of Jan. 13, 1900.

†See F. Buttengbach—Berg und Huttenmannischen Zeitung, vol. 41, p. 153. Also, Revue Universelle des Mines, vol. 10, p. 552.

sible to compare them with the figures of practical lumbermen, it has been found that the tendency is to underestimate the damage. The two latest States to be examined are Oregon and Washington. The former is estimated to contain 234,653,000,000 feet, B. M., in standing timber, the latter 114,778,000,000 feet. Destruction by fire has been serious in Washington. On the assumption that the burned areas contained on an average as much timber as the untouched portion, 40,000,000,000 feet have been destroyed since lumbering began. This amount would supply all the sawmills of the United States for two years, and, at a value of only 75 cents per M., means a dead loss to the State of $30,000,000. The amount actually logged in the same period has been 36,000,000,000 feet, making the estimate by the same comparison of areas. Oregon has suffered less from both fire and lumbering, owing to the smaller facilities for marketing the product.

Wet Crushing and Cyaniding the Siliceous Ores of the Black Hills, South Dakota.

Written for the MINING AND SCIENTIFIC PRESS by JOHN M. HENTON.

In the spring of 1899 the Dakota Mining & Milling Co., under the management of Capt. Seth Bullock, owning the Gunnison group of mines and other claims in the Portland district, west of Deadwood about eight miles, after investigating the merits of the process, decided to try wet crushing and cyaniding of these ores.

In July, 1899, the company commenced to repair a stamp mill in Central City, S. D., near Deadwood, and to build a cyanide addition to it. The mill started up on October 14th, 1899, and from the first the extraction was all that had been expected, and the saving, as far as could be judged from the workings of the new plant, was equally good.

But the wet crushing of these siliceous ores was new and many adjustments had to be made to meet the many difficulties which arose, and it was the first year before any steady, continuous work was done of sufficient duration and amount of ore treated from which a definite determination of the saving could be made. These adjustments and changes were completed by January 8th, and 224 tons of ore milled immediately following that date gave a saving in precipitates, cleaned up and shipped to the refinery, of 80% of the assay value of the ore. There is nothing very remarkable about this only as it shows the success of the method as applied to these ores.

The ore is wet crushed in the ordinary stamp mill battery in the cyanide stock solution. No attempt is made to amalgamate, as the ore contains no free gold. A 6-mesh woven wire screen and low discharge are used. The resulting pulp is of the following fineness: 18% remains on a 20-mesh screen; 12.6% remains on a 40-mesh screen; 5.2% remains on a 60-mesh screen; 7.4% remains on an 80-mesh screen; 7.4% remains on a 100-mesh screen; 49.4% is finer than 100-mesh.

From the battery the pulp is run into a tank 16 feet in diameter and 7-foot staves by means of a centrifugal pump, the floor of the vat being on a level with the battery. The excess of solution is drawn off to the sump by means of floats and is returned to the storage tank, to be again used in the battery, in this way making the use of the solution continuous and but a small stock necessary.

This tank into which the pulp is run from the battery is provided with an agitator appliance of the pattern described by Matt W. Alderson, page 612, MINING AND SCIENTIFIC PRESS, June, 1899, and from plans and specifications thus furnished by him.

When a sufficient charge has accumulated the batteries are hung up and the agitator is started. When the charge is all under the action of the agitator, sufficient cyanide is added to bring the solution up to that strength which has been found best to secure the extraction. This is not always the same and no fixed rule has been followed. At times an extraction of 55% to 75% has been secured in the battery with the stock solution before the treatment proper had begun. Then, again, this battery extraction has been less than 25% of the assay value. The time of agitation is not always the same, but will average about three hours. Stock solution is then run into the agitator and at the same time decanted off, the agitation being continued and the rate of decanting being a little greater than the rate of filling. In this way the slimes are washed out of the sands and into a tank large enough to hold a few days' run and from which the solutions are drawn by siphon. The sands are then run into a percolation vat, where subsequent treatment is by that method.

Zinc shavings are used for precipitation and the solutions are run direct into the zinc box without an intermediate gold solution tank. In drawing from the slimes tank a siphon hose of just the size to equal the working capacity of the zinc box is used. But one zinc box is used and all the gold solutions of whatever degree of strength and richness in gold, and a considerable part of the wash water, are run through this one box. In size it is 13 feet long, 2 feet deep and 2½ feet wide. The zinc capacity of each compartment is 30 inches long, 18 inches deep and 15 inches wide. But four of these compartments are in use. More were used at first, but it was often found that there was no precipitation below the third after solutions had been running through the box for a week, and all below the fourth were discontinued.

The following table will show the conditions of the solutions and the precipitation during the month of January, 1900. The items are continuous and not selected and the values were determined from the assay of ten A. T. quantities made by evaporation.

Value of solution entering zinc box.	Value of solution leaving zinc box.	KCN in pounds per ton.	Alkalinity in % in terms of H2 S O4.
$3 30	None.	1.1	.3
2 80	None.	1.7	.55
3 10	$ 40	2.0	.5
2 80	30	1.3	.45
2 80	15	1.8	.7
2 70	05	2.0	.6
2 70	Trace.	1.9	.45
3 00	15	2.0	.5
3 20	35	2.4	.85
2 40	20	2.4	.75
2 60	05	2.3	.65
4 10	15	2.4	.5
3 20	1 70	2.9	1.00
3 80	15	2.1	.4
3 90	10	2.0	.7
4 80	50	2.2	.55
4 20	40	1.5	.4
4 00	50	2.5	.5
3 50	15	2.2	.4
4 60	30	1.4	.25
4 00	20	2.1	.3

It will be noticed that the one case of bad precipitation is so very bad that it is probably a case of "salt." The rate of the flow of solution was an average of a little more than one ton per hour. It has not been found necessary under ordinary conditions to prepare the zinc box oftener than once a week.

Under the conditions of running the solutions without an intermediate gold solution tank an inflow of ore slimes is certain to occasionally happen through accident and carelessness, and then immediate attention to the zinc box is imperative.

The practise as here set forth is not original, but has been borrowed largely from that of Matt W. Alderson, also from the practise of Charles Butters in South Africa, as given in the MINING AND SCIENTIFIC PRESS, April 16, 1898. The details are given as showing what is being done by wet crushing and cyaniding these ores, and also as showing that by perfecting the work along these lines great success is attainable and practicable. It is not claimed that any of the details of work done represent the best practise, but only that the results obtained were secured in the way stated.

Treating Amalgam and Retorting.

The following is the process for extracting the gold from the mercury amalgam in the Colorado placer mines:

The amalgam as collected, whether from the sluices when working solely alluvial deposits or from plates and riffles when dealing with larger propositions, is carried onto a table slightly inclined with a grooved surface near the lower end, and a hole at the lowest point opening into a receptacle for catching any mercury that may escape. On this table is an iron kettle large enough to hold all the amalgam collected in a single cleanup. Into the collected amalgam and mercury some sodium amalgam—one ounce to each flask of mercury—is introduced, and the whole is stirred. After some time water is poured into the kettle above the mercury and stirred. Sand and mud rise to the surface and are removed with a large sponge. Washing and stirring continue until the surface is comparatively clean. The mercury is then made as dry as possible with the sponge and the whole stirred again with the hands. Some dirt generally rises, which is scraped off with a dry card or piece of leather drawn gently edgewise over the surface. This is repeated till the mercury seems clean.

It is then poured into conical bags of canvas or chamois leather, through the pores of which the mercury runs, or is squeezed, leaving the gold amalgam in the bag. A certain quantity of gold is retained by the mercury, which can only be recovered by retorting, but it is not desirable to do this if the mercury is to be used for further amalgamation, as the presence of gold increases its activity. The retort is a deep cast iron vessel shaped like a bowl; on top is a jointed iron from which an iron tube rises and bends downward. A mixture of wood ashes and clay is prepared. The balls of amalgam are placed in the bowl and the ashes put thickly around the edge. The cover is fitted and clamp adjusted. The retort is placed in a furnace over a moderate fire. The end of the pipe dips just below the surface of water placed in a vessel. When the retort has attained a dull red heat and no more mercury distills over, the retort is allowed to cool. The cover is taken off and the bullion removed. The amalgam after retorting has a gold metallic color. It is ready for the melting pot as soon as taken out. Gold from a placer is usually deposited in the local bank and thence goes to the mint for refining.

The sodium amalgam must be freshly made to be effective. If kept long it oxidizes. Metallic sodium may be kept in wide-mouthed bottles covered with coal oil. Enough for a single cleanup can be made in a small frying pan. A small quantity of mercury from a fresh flask is poured into the pan and dried with a sponge and then heated beyond the boiling point, but not enough to volatilize the mercury. A piece of sodium is cut into ½-inch cubes and the mercury taken out in the open air. A cube of sodium is placed with tongs in the center of the warm mercury. A flash follows; a small portion of mercury is volatilized and another cube of sodium is placed with less flash. This is repeated three or four times, when the sodium sinks down gently. At the proper moment a solid mass of amalgam will appear in the center. The contents of the pan are then stirred, and a few more added cubes change the whole to a mass of crystallized sodium amalgam.

Masonry Dams and Retaining Walls.

NUMBER IV.

Written for the MINING AND SCIENTIFIC PRESS by GEORGE T. PARDOE.

We have now got the theoretical profile of our dam in the rough, as shown by the drawing, and in which the lines of resistance for the dam full and empty are shown by full lines and the boundary lines of the middle third through each joint are shown by dotted lines.

It will be noticed that from joint VIII downwards the line of resistance passes outside the "middle third" when the dam is empty, and that when the dam is full the line of resistance is slightly outside the boundary at joint V, but by so small an amount that it may be neglected unless the work is very important and provided that the masonry is of first-class character. It is, however, desirable to thicken joint V to the outside and from joint VIII downwards on the inside.

NOTE.—The lines of resistance, etc., are shown for the calculated profile.

The profile, as adopted for the construction, may be taken as shown by the dotted lines.

We have now to calculate what the maximum pressure will be on the foundations, taking the calculated profile.

The maximum pressure per square foot on a plane parallel to the foundation is given by the formula.

$$F = \frac{6\,W\,l}{L^2} + \frac{W}{L}$$ where F = maximum pressure,

W = total weight of masonry,

l = distance from center of joint to center of resistance.

L = length of joint.

Substituting figures for the above and for the whole dam, we have for reservoir full:

$$F = \frac{6 \times 4.6 \times 149735 \text{ lbs.}}{33^2} + \frac{149735}{33} = 4537 + 3795 =$$

8332 lbs. per square foot on outer face.

And 4537 − 3795 = 742 lbs. per square foot on inner face.

For reservoir empty we have:

$$F = \frac{6 \times 149735 \text{ lbs.} \times 5.6}{33^2} + \frac{149735}{33} = 9147 \text{ lbs. per}$$

square foot on inner face.

And 4610 − 4537 = 73 lbs. on outer face which is in tension.

It must be distinctly understood that this formula is based on the supposition that the material of which the dam is constructed is of uniform elasticity over its whole cross-section. This is not always strictly correct but is probably near enough for practical purposes and no serious trouble has hitherto been caused by neglecting any possible error on this count.

Having found the pressures at the faces, we may draw two sloping lines connecting perpendiculars erected at the ends of the base, the height of these perpendiculars being (to any convenient scale) proportionate to the pressures at the faces. The height of these sloping lines above the joint for which they are drawn represents by the same scale the pressure at any point on the joint. (See drawing.) By this means we can determine any convenient limit of stress for each joint within which limits we can use a cheaper class of material, such as concrete, which plan is sometimes advisable, but in the case of such a small job as this any possible saving is so small as not to be worth the risk of unequal settlement or other troubles.

The principle on which we have hitherto based our design is the law of the trapezium and its consequences, first proposed by Deloncle, and on which the design of many large dams have been based.

A modification has, however, been proposed by M. Bouvier, Ingenieur des Ponts & Chaussees, and although not correct it may be used with advantage provided that the angle which the resultant makes with the base is not very great.

Put into simple form, M. Bouvier appears to believe that it is not correct to consider the streams produced on a horizontal plane but that they should

be considered with reference to a plane normal to the resultant, which means, of course, if we consider the case of reservoir full, the C. of resistance is moved further towards the outer face with respect to both the middle third and the center of the supposititious joint.

To complete our calculations for our dam we will briefly consider the stress on the outer face by M. Bouvier's system.

Draw a sloping bed from the outer face at joint X normal to the resultant, and which bed will therefore be at about 50° to angle below the horizontal.

From the inner end of joint X drop a perpendicular onto this sloping bed, and the point where the perpendicular cuts it is the inner end. The length outside this is not allowable in the calculation.

On this line set out the limits of the middle third, and by means of the formula previously given (in which "W" will now be the value of the resultant instead of weight of masonry) we can calculate the maximum stress on the outside of dam when full.

In such a small dam as the one under consideration the maximum pressures at the faces should be in any case so small with respect to the safe limit of the materials that there is no necessity for the refinement of calculation and large increase of labor caused by adopting this theory as absolutely correct, and it is also not generally accepted and may be considered more as a scientific means of varying the factor of safety with varying angles of the resultant.

If we draw the lines to represent the inclined base, the water thrust, the weight of masonry and the resultant of forces for the whole dam, we have the following approximate quantities:

Length of base = 28.5 feet.

Distance between resultant and half width of base = 3.6 feet.

Resultant = 179000 lbs.

Intensity of pressure at outer face due to bending action $= \frac{3.6 \times 179000 \times 6}{28.5^3} = 4565$ lbs.

Mean intensity of pressure $= \frac{179000}{28.5} = 6070$ lbs.

Therefore the maximum stress along a line parallel to the resultant and at the outer face = 10635 lbs.

Now the pressure thus calculated may be split up into two forces, one horizontal and the other vertical and parallel to the vertical pressure calculated by the formula based on the simple theory previously explained.

Obviously, the vertical component bears the same relation to the resultant, as the cosine bears to the radius of the angle of deviation of the resultant. This angle is approximately 90°—2° and cosine = 0.96, and therefore 10635 × 0.86 = 9146 pounds = resultants.

M. Bouvier's idea appears to be that it is only correct to take the forces as acting on a place normal to the resultant.

This is, however, obviously not strictly correct, since the dam is—or should be—being built of rubble masonry and consequently there is not strictly any such action as described by him under the term "equivalent normal reaction."

TO BE CONTINUED.

In the Massachusetts Institute of Technology, in the course of electrical engineering, a student has chosen for his subject a study of the size of wire necessary when aluminum is used for a conductor of electricity, the relative capacity of aluminum as compared with that of copper. As the price of copper has risen so much and as the price of aluminum has fallen, the use of the latter metal has already begun to compete with that of copper in electrical manufactures. Insurance people have appointed a committee to follow the results of such tests and to make tables from them, as it is most important to know, when buildings are wired, the safe limit of the amount of current which any wire, covered or uncovered, may be made to carry. The method chosen for determining the relative capacity of the aluminum is one in which the temperature of the wire will be measured directly while it is carrying different amounts of electricity.

Details of Cost of War Eagle Mine Operations.

General Manager Kirby of the War Eagle mine, Rossland, B. C., furnishes detailed tabulation of the amount of work done, the cost of production and the smelter returns, all of which is of practical value and is condensed in the following:

The figures given show in detail: (a) The product of the mine for year ending September 30th, '99, as well as for October, November and December of last year: (b) Table showing width of stopes and percentages of pay area in main ore shoot December 31st, '99: (c) Table showing production and grade of ore from each level up to December 31st, '99, from main ore shoot only: (d) Comparative statement of work done and its cost per foot or ton from January 20th, '97, to December 31st, '99: (e) Table of mine costs for twelve months ending September 30th, '99.

values for three months—October, November and December of '99:

Tonnage	22,693
Smelter's gross assay value	$401,873 55
Smelter's net value	265,711 50
Smelter's gross value per ton	17 71
Smelter's net value per ton	11 71

TABLE SHOWING WIDTH OF STOPES AND PERCENTAGES OF PAY AREA IN MAIN ORE SHOOT DECEMBER 31ST, '99.

Portion of Ore Shoot.	Area of Stopes, Square Feet.	Stoped Area in Percentage of Shoot Area.	Average Width of Stopes, Feet.
Block above level No. 1	37,850	78	5.2
Block above level No. 2	45,000	66	8.1
Block above level No. 3	38,480	56	8.3
Block above level No. 4	17,500	42	8.9
Block above level No. 5	12,270	37	13.2
Block above level No. 6	9,280	19	10.0

NOTE.—On levels 5 and 6 the stopes are still being extended. The first four levels are about worked out, so the percentages given show the total pay area. The stoped area in percentage of shoot area is an approximation.

TABLE OF MINE COSTS FOR TWELVE MONTHS ENDING SEPTEMBER 30TH, '99.

	Development Work. Cost Per Foot		Ore Extraction. Cost Per Ton		
	Sinking Main Shaft.	Sinking Small Winzes.	Raising.	Drifting.	Stoping.

Totals	122,681	$20 48

PRODUCT OF THE MINE FOR YEAR ENDING SEPTEMBER 30TH, '99.

Tonnage	51,243
Smelter's gross assay value	$824,852 92
Smelter's net value	505,562 03
Smelter's gross value per ton	16 28
Smelter's net value per ton	9 92

To this may be added figures showing product and values for three months—October, November and December of '99:

Tonnage	22,693
Smelter's gross assay value	$401,873 55
Smelter's net value	265,711 50
Smelter's gross value per ton	17 71
Smelter's net value per ton	11 71

Notes on Mill Work and Results Thereof.

Written for the MINING AND SCIENTIFIC PRESS by E. L. BALLOU.

The results of mill work here given were obtained the past season at the Garnet G. M. Co.'s 20-stamp mill near Pony, Montana. The ore worked was a tough quartz with vein matter, the whole carrying 4% of partly oxidized sulphides of iron, lead and copper. The gold was very fine and alloyed with silver, making the bullion worth $13.50 per ounce.

The ore passed through breaker, self-feeders, under 950-pound stamps and through thirty-mesh steel wire cloth. The pulp then passed over lip, apron and sluice plates, and plates were also used on the vanner spreading boards. The pulp was sized before passing to the two 4-foot corrugated and four 6-foot plain belt vanners. No quicksilver was used in the mortars, but was sprinkled on the lip and apron plates, as required. The free gold varied from $1 to $6 per ton of ore, and a better saving was had on the richer ore.

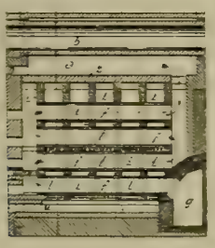
The apron plates were dressed every six hours, the

amalgam being removed as often as its condition and the quantity warranted—usually once a day. A full clean-up was had the first of each month and a partial one on the 15th. Battery samples were taken every six hours and tailings outside the mill every three hours throughout the season. The accumulated samples were dried and assayed once a week, or oftener if necessary.

In 166½ working days 7645 tons of ore passed through the mill. From the plates 447 pounds of amalgam were obtained in thirteen clean-ups. No gold was obtained from the mortars. The amalgam was ground with an excess of quicksilver and squeezed in hot water. The retorted gold still carried sufficient sulphides to form a troublesome matte when melted. This was got rid of by removing the crucible from the fire as soon as its contents were melted, watched until the gold chilled, when the still liquid slag and matte were poured off. When again melted, a little niter was added and the gold poured. This was found the quickest and cheapest way to get clean bars.

The free gold was 62% of the value obtained, the balance being in the 308 tons of concentrates.

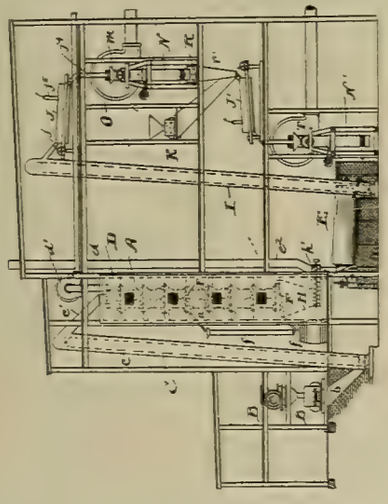
The loss of quicksilver from all sources for the season was 37½ pounds, or a trifle less than five pounds per 1000 tons of ore crushed. Formerly, when using quicksilver in the mortars, the loss was six times as much, the saving of free gold being rather less than with outside amalgamation.



The mill saved 82.2% of the assay value of the season's run of ore, the loss of silver being more than that of gold.

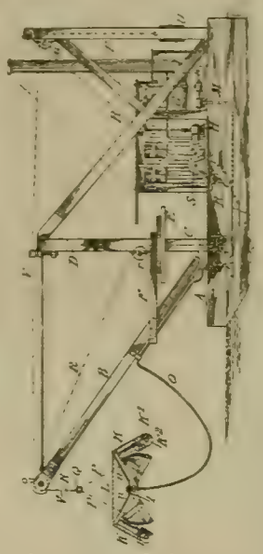
Latest Mining and Metallurgical Patents.

Patents Issued Feb. 27, 1900.



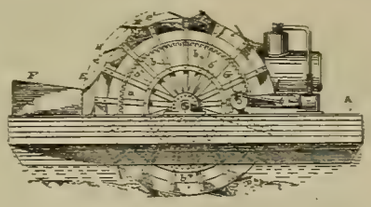
Specially Reported for the MINING AND SCIENTIFIC PRESS.

METALLURGICAL FURNACE.—No. 644,162: J. A. Drake, Ovenden, England.



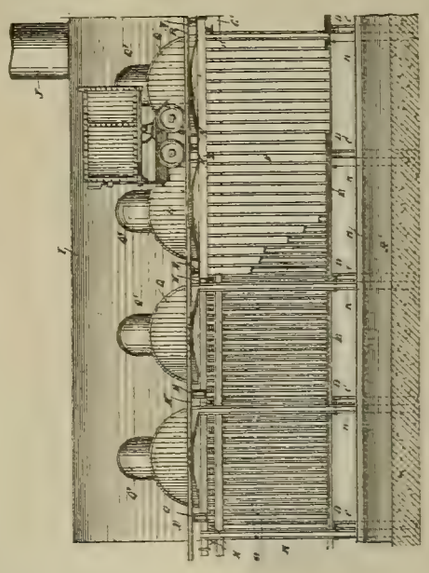
In a regenerative furnace, combination, with an outer casing, and series of longitudinal heating flues F arranged therein one above the other, forming a tortuous passage for the products of combustion; of a series of transverse imperforate walls I supporting flues and forming a series of cold-air passages having no communication with each other, tiles arranged in passages so that cold air is conducted around each heating flue, and a series of longitudinal air-inlet passages U arranged under flues F, each cold-air passage being provided with a separate inlet passage so that the air passing through each can be regulated separately to secure uniformity of temperature.

APPARATUS FOR SEPARATING METAL FROM ROCK.—No. 644,181: C. H. Lane, Cleveland, Ohio.



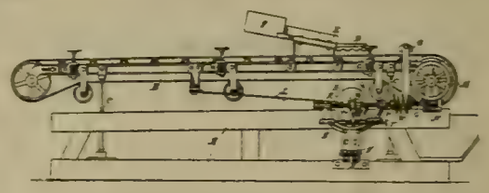
In an apparatus for separating metal from rock, the combination of a series of crushing rolls adapted to act successively upon the material to reduce it to a pulverized condition, a drier, a beater device, an inclined air separator tube, and mechanism for conveying the material from one and delivering it to another of the devices in the order stated, with an outlet pipe connected in the upper end of air separator tube, a settling chamber connected in pipe, a suction fan for creating an air current up through air separator tube and through its outlet pipe, and settling chamber, a discharge pipe connected in lower end of settling chamber, a screw conveyer therein, a spring-actuated valve for closing the outlet of discharge pipe, a crushing device into which pipe discharges, a beater device into which crushing device delivers its product, an inclined air separator tube, means for slowly delivering material from beater into tube, an outlet pipe connected with end of air separator tube, a settling chamber connected in outlet pipe, and a suction fan connected with pipe beyond the settling chamber.

DREDGER.—No. 644,457; W. B. Pless, San Francisco Cal.



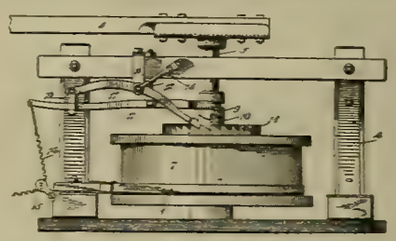
A dredge bucket composed of two sections pivoted together by means of bails or yokes, a cylinder and piston secured to each yoke, a guide on each piston, guides on yokes, a chain or cable connecting the two cylinders and passing over guides and fluid pressure connections to both cylinders, whereby the outward movement of piston causes the bucket sections to close.

ROTARY DREDGING AND EXCAVATING MACHINE.—No. 644,521; D. Jordan, San Francisco, Cal.



In a dredging machine, combination of scow having well or opening, dredging wheel mounted to rotate in opening in contact with submerged bottom to be dredged, alternately disposed cutting and excavating devices and water elevating devices on periphery of wheel, slanting aprons connecting back of one device with bottom of device next in front, and receptacle on scow adapted to receive material and water from the discharge side of the wheel.

FURNACE FOR DESULPHURIZING ORES.—No. 644,424: H. Guyer, Casapalca, Peru.



An ore desulphurizing furnace, comprising a series of posts, cross-ties therein, firebox set on cross-ties provided with channel iron bottom resting on cross-ties, grate bars set in channel iron bottom extending upwardly and outwardly, longitudinal binding bars for upper ends of grate bars, transverse anchor rails for binding bars and grate bars, binder posts outside of grate bars and connected with the anchor rails, longitudinal bars for binder posts, and transverse holding beams having curved ends for engagement with longitudinal binder post bars.

CONCENTRATOR.—No. 644,289; G. Gates, Jackson, Cal.

In a concentrator, a combination with belt and feeding devices, of a trough interposed between same and constructed with connected channels from which pulp successively overflows from one channel to the other, channels provided with bottom discharges whereby pulp is delivered directly upon belt, at different points in length thereof, depending on its gravity, the feeding devices connecting with initial channel of series. An endless traveling belt concentrator, combination with moving belt of series of troughs extending transversely above belt having edges connected to form continuous overflow from one to another, spaced perforations made in bottoms of troughs from end to end, perforations alined transversely of troughs and in line lengthwise of belt, and a preliminary distributer consisting of divergent troughs by which pulp is delivered from a common supply into first trough simultaneously from one end to the other; mechanism for distributing and grading pulp and afterward depositing it upon endless traveling belt for concentration.

HOIST.—No. 644,468: R. Rutter, South Butte, Mont.

Hoisting apparatus, combination with frame or support, of drum mounted to turn thereon, clutch serving to transmit movement to drum, a lever mounted on frame or support and having connection with clutch to actuate same, ratchet attached to drum, and pawl working with ratchet to prevent back movement of drum when the clutch is in gear, such pawl having connection with clutch lever so as to disengage pawl from ratchet simultaneously with disengagement of clutch.

Cost of Coal Output.

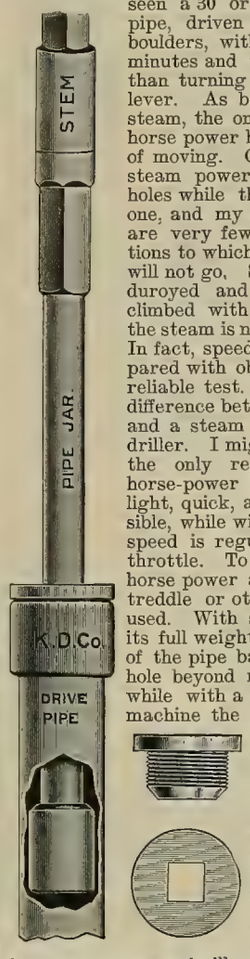
Now, when coal is both scarce and dear, and a likelihood that it will become still dearer, it is of interest to know how the leading coal-producing countries compare in reference to the cost of their fuel and the efficiency of their workers as illustrated by the average output of coal per employe. Following are returns from the official statistics of the countries enumerated of the average value at mine of the coal production of the different countries, with the average annual output per employe:

	Average value. s.	d.	Average annual output per worker. Tons.
Great Britain	6	6	297
Russia	6	9	176
Sweden	7	11½	138
Germany	7	4½	271
Belgium	8	3½	179
France	8	8½	216
Spain	6	1	112
Austria	6	1½	181
United States	4	7½	450
Transvaal	1	8	224
British India	3	8½	68
New South Wales	5	1	455
Victoria	9	2	264
Tasmania	8	0	320
New Zealand	10	0	440
Cape of Good Hope	14	3	56
Natal	10	0	156

British India presents the conjunction of the cheapest coal and the lowest average output per worker, attributable to the low wages paid in that country. The dearest coal produced on a large scale is that of France; the United States, owing to the large average output per worker, shows, next to India, the lowest cost.

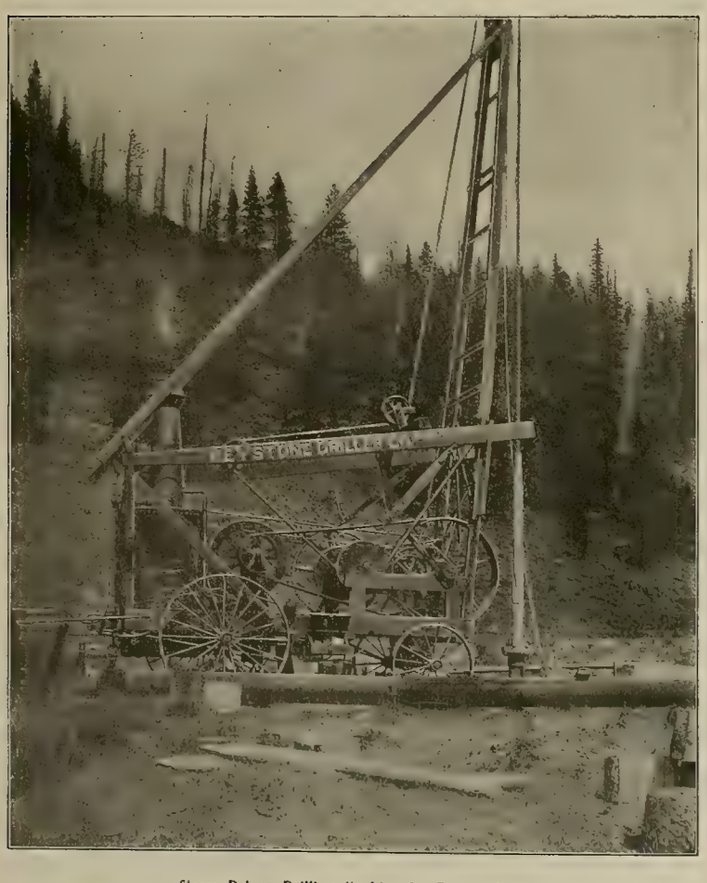
Proper Testing of Gold Dredging Ground.

Written for the MINING AND SCIENTIFIC PRESS by R. M. DOWNIE.



I notice in your issue of Jan. 27th an article on "Dredging for Gold," in which is illustrated and described a method of testing dredging ground by means of a light horse-power drill. Some of the suggestions in the article are good, but others are misleading. I will endeavor to correct some points as they occur to me and to suggest others.

First—A machine weighing less than 1000 pounds, "all told," is a mere toy and wholly inadequate. The article suggests a drill bar 12 to 15 feet long, 3 or 4 inches in diameter. Such a bar is about right, but it alone will weigh 500 to 600 pounds. Add a rope socket, say 50 pounds, jars 250 pounds, and say two bits at 150 pounds each, and we have about 1200 pounds in the necessary drilling tools alone, without allowing anything for machinery, sand pumps, driving head, horse-power, pipe pulling attachments, etc.



Second—The article suggests a sand pump 3½ feet long. Such a tool is inadequate and no one tool of this kind can be made which will suit all requirements. It is true that such a sand pump is about all a 1 H. P. machine will handle correctly, but to do good work and clean the hole effectively the pump should be of the style known as the vacuum pump. Such a pump will, in sand or small gravel, load itself full out of the bottom of the well and bring with it everything. We must remember that gold does not, of its own volition, rise into the stirred-up gravel and sand. A light sand pump will serve to gradually extract the mud and slush, but what is wanted is a tool which will, by suction, sink itself into the undisturbed formation and bring up everything within the area of the pipe. To load such a pump and start it from its bed in the sand often requires a pull of 2000 to 3000 pounds, and the force must be applied rapidly to get the best results. Neither one horse nor two nor three will do this. Many a good proposition has been condemned by using an inadequate sand pump, leaving the gold in the bottom of the hole, to be driven off by the drilling tool into the sides of the wall and lost.

Third—The article further suggests greasing the outside of the pipe to be driven. This I consider a mistake. There should be no grease or oil whatever used in setting up the pipe or on the outside of it. If grease is used about the pipe it will inevitably become mixed with the drillings and make it impossible to pan the gold accurately. The grease on the outside of the pipe is wholly useless for the purpose intimated (to make the pipe easily withdrawn), and if used will prevent an accurate test being made. If anything is used to lubricate the joints of the drive, plumbago, moistened with linseed oil, should be used, and that sparingly.

To withdraw the pipe, the process of driving it should simply be reversed, using pipe jar, as shown in the illustration.

With such a tool and a properly constructed machine lifting jacks are not always needed. I have seen a 30 or 40 foot string of 6-inch pipe, driven solidly into gravel and boulders, withdrawn in less than five minutes and without other hand labor than turning a throttle and pressing a lever. As between horse power and steam, the only possible advantage the horse power has is in the one matter of moving. Once on the ground, the steam power will make three or four holes while the horse power is making one, and my experience is that there are very few possible dredging locations to which a good traction engine will not go. Swamp roads can be corduroyed and a 20% grade can be climbed with them. The advantage of the steam is not altogether in the speed. In fact, speed is a small matter compared with obtaining an accurate and reliable test. To fully understand the difference between a horse-power drill and a steam machine, one must be a driller. I might say, however, that as the only regulator of speed on a horse-power drill is the horsewhip, a light, quick, accurate stroke is impossible, while with the steam machine the speed is regulated to a nicety by the throttle. To make it possible to use horse power a machine with cam and treddle or other stop motion must be used. With such motion the drill falls its full weight and packs the contents of the pipe back into the walls of the hole beyond reach of the sand pump, while with a properly arranged steam machine the drilling is done on what drillers call "the spring of the line." This enables the operator to make sixty to seventy light "touch-and-come" strokes per minute as against twenty to twenty-five dead "punch-and-settle" strokes of the horse-power driven machine. The difference, in effects produced, between these two processes is illustrated in the fact that, if a hard boulder is struck with the slow-motion drill, it is liable to be driven off to one side to afterward help wedge the pipe, while with the light, quick, steam-driven drill, a boulder (even if only a corner of it projects into the area of the hole) is drawn into the well and cut up. That this is true will not be questioned by practical drillers who have worked both kinds of machines.

Steam Driven Drilling Machine for Prospecting.

The importance of this difference is manifest when it is remembered that what happens in the case of the boulder also takes place, in some degree, with reference to all the materials found in the area of the test hole. With the dead stroke of the horse-power machine, very much of the cuttings is driven off and packed into the walls of the well and is not brought to the surface at all. That this is true can be readily proven by measuring or weighing the materials excavated by the horse-power drill and comparing the volume taken up with solid contents of the area of the hole. On the other hand, the light, quick stroke of the steam-driven drill, of the proper construction, makes it possible to show at the surface a volume of material equal to that required to fill up the hole full to the top.

To make an accurate assay of the ground prospected, all the material within the area of the drive shoe must be produced at the surface and the gold extracted from it. If either more or less is taken up a correct estimate cannot be made.

The cut of the machine shown illustrates one kind which is used with success.

The above is written from the experience of one who has made the subject an experimental study for about thirty years.

Portable One-Stamp Mill.

The portable one-stamp mill herewith illustrated is designed to enable the miner to test ore by working it in an economical way, and thus determine whether it will be profitable to erect a large mill.

Fig. 1 is a general view of the mill. The mortar is preferably made circular in horizontal section, and is oval shaped in vertical section. It is 8 inches diameter inside; the shoe and die, made of chilled iron, are 4 inches diameter, there being room for feeding ore and for splash. The hole through the top of the mortar serves as the lower bearing for the stamp rod, which, with tappet and shoe, weighs forty-five pounds, and drops 6½ inches to 7 inches with a force of 750 pounds. The upper part of the mortar supports the two iron columns or pillar blocks for the cam shaft. One of these columns projects above the shaft, and the top of it serves as the upper bearing for the stamp rod. There is a screw at this place. By turning it the stamp rod is held fast while cleaning up the mill. The ore is fed through a large hole at the side of the mortar near the top. There is also a half-inch pipe and stop cock to supply the mortar with water. The discharge at the front is square, 6 inches by 6 inches, and the screen is fastened by wedges in the usual way. The mill is furnished with five sheet-iron slot punched screens and five assorted meshes.

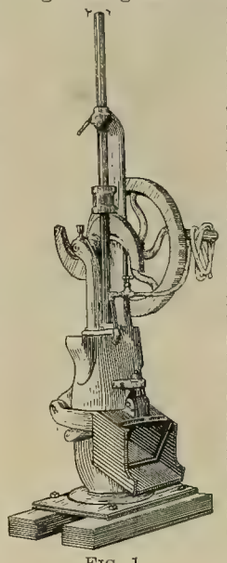


FIG. 1.
(Patent Applied for.)

The mortar is divided longitudinally into two parts, the upper part being fastened to the lower by a hinge pin and one hinge bolt. When the nut of the latter is loosened, the upper part of the mortar with all its belongings can be turned over to rest upon the ground, as shown in Fig. 2. This arrangement

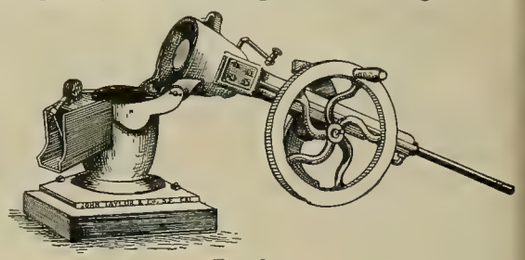

FIG. 2.
(Patent Applied for.)

is intended to give greater facility for rapid and effective cleaning up; by withdrawing the hinge pin the upper half can be entirely removed, thus rendering it portable. A rubber gasket placed between the two parts of the mortar prevents leakage, when the bolt on the front side of the mortar is tightened. The flywheel upon the cam shaft is 18 inches in diameter, and takes a 1½-inch belt. The mill can be operated by hand or power. It is made and sold by John Taylor & Co., 63 First St., San Francisco, Cal.

SECRETARY GAGE is trying to have Congress enact legislation placing the hydrographic office of the navy under the Coast and Geodetic Survey.

MINING SUMMARY.

CALIFORNIA.

AMADOR COUNTY.

(Special Correspondence).—The Wildman-Mahoney properties in Sutter Creek since 1894 have been under joint management. There is a 40-stamp mill on each property, which is kept running upon ore from its own mine. Water power is delivered at the Wildman under a vertical fall of 525 feet. Besides a separate wheel for the hoist, air compressors, saws, etc., the water is pumped out of the mine by a Knight hydraulic pump. The mine water is caught in a tank at the surface and used in the batteries of the mill. The Wildman incline shaft is 1300 feet deep. A bucket is used in a single compartment, and it is no easy task to keep the 40-stamp mill supplied with ore under these conditions. Yet it is done, even while retimbering is being done in the shaft. The ground at the Wildman is constantly swelling, necessitating heavy and careful timbering. At the Mahoney the shaft is down 1000 feet, where it is connected with the 800 level of the Wildman, the latter being on the lower ground. The Mahoney is a large three-compartment shaft, in which 2½-ton skips and 450-gallon water tanks are used. The 9-foot water wheel is direct connected to the double-reel hoist. A large standing crane, with hydraulic connections, expedites the handling of timbers. The two properties have 165 employes, disbursing about $14,000 per month. The ore is 2% sulphurets, and these are shipped to Selby's. The Emerson vertical shaft, several hundred feet from the Wildman mill, will strike the vein at a depth of 2200 feet. It is contemplated to build a 100-stamp mill near the Emerson shaft. This will give the company an equipment with 180 stamps. The Wildman is a close corporation, the principal stockholders being Boston people. John Ross, Jr., is Supt.; David Ross, accountant; S. C. Thomas, foreman of mine; Jas. A. Little, chief machinist.

The Lincoln mine joins the Mahoney on the north. It is one of the old claims of the district, and yielded fully $4,000,000 before being abandoned years ago. Below the 600-foot level a rich ledge was broken off abruptly; there the early workers quit. For 350 feet from the surface they had extracted ore from a shoot 12 to 30 wide that paid $20 to $100 per ton in free gold. Another rich shoot was worked 160 feet through the Stanford shaft. It is the effort of the present company to rediscover this gold-bearing formation. They have opened up the old caved shaft and sunk 450 feet deeper. A crosscut below the old workings encouraged the company to continue sinking, and now another crosscut is being run at the lowest depth in the shaft. The mine has a large double reel steam hoist and air compressor. The change room is heated by exhaust steam. Water from the mine is hoisted in 500-gallon skips, and of these there are about ninety each twenty-four hours. Ex-Senator E. E. Voorheis is Supt. of the Lincoln and also joint owner of extensive reduction works at Sutter Creek. The mine employs twenty-five men.

Sinking goes on at the Mutual mine, joining the Lincoln on the north. The vertical shaft is down 350 feet. The 90 H. P. boiler is encased in a non-conducting preparation made of sawdust and lime. S. R. Porter, also of the Baliol, is Supt. About twenty men are employed.

The Keystone mine at Amador City is the largest enterprise on the northern portion of the Mother Lode. It has been in operation for nearly fifty years, and has produced many millions of dollars, four or five millions having been distributed in dividends. Supt. Prichard says that the mineral formation is here 300 to 400 feet wide, with heavily mineralized ledges of varying width coursing through it. At places several of these ledges come together, making a large ore body of great richness. The shaft is vertical, and is now 1200 feet deep. At the hoisting works, which are located on the hillside, 100 feet above the mill, there is a double-reel steam hoist. It does its liveliest work in hoisting water, which is brought up in 520-gallon tanks. Of these, 100 gallons are hoisted each night, at the rate of thirty-two per hour. Fitted to the hoist is an ingenious indicator to mark the position of the skip. The mill is run by water power under 285-foot pressure, and is equipped with forty stamps, two roller mills and eight concentrators. Twenty stamps can be run by a 34 H. P. gasoline engine. The present management of the Kennedy is in the hands of young men. Supt. W. A. Prichard is a graduate from the School of Mines of the University of California, and is probably the youngest superintendent in the State; C. E. Bunker is foreman; W. L. Cobb is metallurgist. About 100 men are employed. Below the Keystone mill is an extensive blanket plant run by Hottinger Bros. They pay the company one-fourth royalty.

At the Bunker Hill mine, north of Amador City, development work is done. This was an extensive mine, with one shaft 1000 feet deep, another 800 feet deep and a 20-stamp mill connected by wire tramway with the hoists. A new company, with C. R. Downs as Supt., has cleaned out and repaired the old workings. A new hoisting works will be put in. The old 800-foot shaft will be sunk 400 feet farther.

The Fremont Con. comprises four claims, three of which lie for 4200 feet along the Mother Lode—the Fremont, Gover and North Gover. The Loyal Lode is a parallel location with the last named. The company owns a section of land, part under agricultural patent. The Gover mine yielded $1,000,000 within three years with a 10-stamp mill. The shaft was 1500 feet deep. The reorganized company now conducting operations is sinking a double-compartment shaft 1500 feet north of the old Gover works; it is now down 167 feet Goodall, Perkins & Co. are controlling stockholders, C. E. Purrington is Supt. and Wales Palmer foreman. The present work began Jan. 2, 1900. Twenty men are employed.

The Centennial and Pocahontas are active properties near Drytown. The latter is superintended by Allen McWayne, principal merchant at Drytown. The formation is disturbed, and it is desired to attain depth, where it is thought an unbroken ledge will be found. At the Centennial, under the superintendence of L. A. Gross, there is a ledge along which in the foot wall gouge they have sunk 630 feet. There are crosscuts at various levels, the last, at 250 feet, showing a ledge 17 feet thick. It is proposed to go 1000 feet before crosscutting again. New machinery, consisting of steam hoist, pumps, blowers, etc., will be put in. The stockholders in this company are largely Boston people. Seventeen men are employed; Robert Reed foreman.

The New Western M. & R. Co. is prosecuting at Plymouth. It is proposed to work over the old ore dumps of the Empire and Pacific mines, two rich properties formerly operated by Alvinza Hayward. There are thousands of tons in these dumps, and, even with enlarged works, it will require several years to finish the undertaking. The present plant is to be doubled as to machinery equipment and an extensive blanket plant will be added. This work is now going on under the superintendency of T. C. Woodworth.

The Shenandoah is 1½ miles north of Rlymouth. The present shaft was started in May, 1899. It is 275 feet deep. A crosscut has been run back to the ledge. S. K. Thornton is Supt. Mr. Thornton has devised a self-dumping device for his buckets. Eleven men are employed.

At the Gowanus, near Plymouth, a vertical shaft is being sunk with machinery formerly on the Anita mine, near Jackson. It is expected to strike the ledge at a depth of 200 feet. There are four ledges on the property. The mine is owned by the High Point Co., composed mainly of Des Moines, Iowa, stockholders, who are also developing at this time the Manhattan and an adjoining claim at Stent, Tuolumne county. A. Rodger is Supt. at the Gowanus.

Plymouth, Feb. 24.

CALAVERAS COUNTY.

The Hannon property near Petersburg has been leased to a San Francisco company for twenty years for mining purposes. Twenty thousand dollars' worth of dredging machinery will be used.

Unwatering the Union copper mine at Copperopolis is completed. New machinery will be bought.

The Melones M. Co. at a special meeting in Boston on the 7th voted to issue 35,000 shares of $10 each in 12% preferred stock in addition to the present capital of $2,000,000; to convert 35,000 shares of common stock in the treasury into 12% preferred stock, the 70,000 preferred shares thus provided for to be sold to provide money.

EL DORADO COUNTY.

(Special Correspondence).—Since my last letter a fine body of ore, 5 feet wide, has been struck in the bottom of the Ribbon Rock shaft. The ore shows plenty of gold. This property is being operated by Hayward & Davis. I understand the old Eply mine just north of the Ribbon Rock will be opened again after being idle for many years. In former years this mine produced considerable ore milling over $20 per ton.

The Loupole mine, east of Placerville, recently purchased by some Indiana people, is being equipped and will be run upon a more extensive scale.

The lessees on the Poverty Point mine, the property belonging to the late John Melton estate, are running fifteen stamps constantly and are doing well.

The Blue Gouge mine has started up four Huntington mills upon their property, and if they succeed in saving the values, it will be worked upon a large scale, as the ore bodies are large.

The Gentle Annie group of mines, also controlled by the Melton estate, have been idle since his death, owing to some complications.

The Kimball & Kohn mill is running and employing about thirty men. The Chapman & Parker gravel mill is also running.

The Union mine (old Springfield) is doing well and a 10-stamp mill is now being put up on the adjoining property.

The information given in my last letter reporting a 7-foot vein in the old Vann mine was incorrect.

The old mine in Jayhawk district, formerly worked by Blakmore Bros., is now being worked by Pownstown & Hayward.

The Boulder mine and mill, controlled by the Willman Bros., is now under bond to a Scotch company. Allen Morrison is Supt. and the mill runs are satisfactory.

The Larkin mine has a fine body of ore on the 600-foot level. They are working about forty men.

Springer Bros. brought in last week several hundred dollars worth of as fine specimen gold as ever came into Placerville. It was taken from the ranch near Ringgold and last year they took out several thousand dollars near the same place. Pretty good ranch! Turns out fruit in the summer and gold in the winter.

The Big Canyon mine is running as usual—thirty stamps.

The Vandalia mine is running its cyanide plant and treating forty tons per day. This property has a showing that justifies a 100-ton plant.

Mr. Bell has just returned from London where he has made arrangements to put up a big electric power plant at the junction of Rock creek and the American river. The water for the power is to be obtained from the American river. This plant will be situated about three miles from Placerville and the new company expect to furnish power enough to supply this whole county, and at a price so reasonable that many old mines now lying idle will be enabled to resume operations at a profit. MINER.

Placerville, Feb. 28.

MARIPOSA COUNTY.

(Special Correspondence). — The Mt. Gaines mine has closed down, Geo. Crocker, the owner, instructing cessation of operations.

Hornitos, March 6.

PLACER COUNTY.

(Special Correspondence).—The Hathaway Con. G. M. Co. now has under bond six claims, embracing 6756 feet along the Hathaway ledge, viz: the Plantz, Jacobson, Kirkland, Hathaway, Butts Extension and Eureka. This consolidation was effected through A. B. Eastwood, Supt. of the Hathaway, who has been instrumental in influencing the Standard M. Co. of Bodie to take hold of the new enterprise and supply him with capital sufficient to thoroughly prospect the property at most favorable points. One of the first things to be done was to erect on the site of the old Hathaway mill a plant of greater efficiency and practically new. This work is now going forward, under the superintendence of W. C. D. Body. It will be a modern 20-stamp mill, with provision made to add ten stamps if future developments shall warrant. A new shaft has also been started on one of the other claims, where adequate prospecting machinery has been placed. Supt. Eastwood does not expect to uncover a bonanza. His previous experience at the Hathaway has convinced him that the consolidated claims can be developed into a reliable low-grade proposition, and his efforts will be directed on this line. At the Hathaway shaft, where the chief work is being done, there is a double-reel friction hoist, run by water power, capable of hoisting from a considerable depth beyond the present lowest level—630 feet. Here several miners are running drifts under contract. The Hathaway is near the old town of Ophir. About thirty men will be employed after the new mill starts.

Work at the Gold Blossom, one mile from the Hathaway, is now partially suspended, awaiting development, under contract, in the mine, in the way of running drifts. There is a fine equipment on this claim, consisting of a 20-stamp mill, double-reel hoist, etc. The vertical shaft is 400 feet deep. The property is owned by G. A. Wiltsee, the C. F. Reed estate and others. J. E. Walsh of Auburn is Supt.; J. C. Dirlam, foreman of mill.

The buildings which covered the equipment of the Grass Ravine, or old Black mine, near the Gold Blossom, were destroyed by fire one year ago and have not been rebuilt. The hoist is temporarily housed in a shack made from corrugated iron left over after the fire. There has been no attempt to reconstruct the 5-stamp mill, and none will be made until there has been greater development in the mine. The shaft, now 325 feet deep, is being sunk under contract, and will be continued to a depth of 450 feet before drifting. This property is owned by the White Sewing Machine Co. and other parties of Cleveland, O., with Dr. T. W. Waterhouse of Newcastle as Supt.

It is doubtful if there are many finer prospecting outfits in the State than that on the Three Stars property, seven miles west of Auburn. It is the policy of this company to develop an extensive mine before a mill is erected. There are three shafts—the Three Stars or south shaft, the Belmont or north shaft and the Elmont or west shaft. Each is equipped with an excellent friction hoist, run by compressed air. The air compressors are run by water, and two of them are stationed in the large machine shop of the company, centrally located as to the various shafts. The machine shop is exceptionally well equipped with lathes and labor-saving devices. One that particularly attracted your correspondent's attention was a trip hammer made from a condemned power-drilling machine. By its use the blacksmith can shape and sharpen many of his drills in less than half the time required by the ordinary method. At the Three Stars vertical shaft a depth of 725 feet has been attained; at the Elmont vertical, 524 feet; and at the Belmont incline, 500 feet. Work is proceeding at each shaft, except the Elmont. The company has a system of keeping a close record of the work accomplished by its men in sinking and running drifts, and offers a bonus for every foot attained in excess of a certain standard. This policy serves as a fine stimulus to the miners. At present thirty men are employed. E. J. Kendall is Supt. The property is owned by Senator E. W. Chapman and associates.

Auburn, March 5.

SHASTA COUNTY.

(Special Correspondence).—Near Keswick, on the Cape Nome claim, Thos. Lewis is employing four men and has an 85-foot tunnel on a 5-foot ledge of low-grade ore.

In Old Diggings district Lewis & Co. are driving a tunnel on a ledge of copper ore that assays $1.60 in gold and a high percentage in copper.

In the Bennington group Supt. Foster has cleaned out the old works, and in sinking a winze has found the pay shoot, from which he is getting high-grade ore. An assorted shipment of forty tons is being made this week.

A half interest in the Treasure mine, near Whiskytown, has been bonded to J. S. Manlove, who owns the other half interest, and work will be resumed shortly.

The Summit mine, near Whiskytown, owned by Donihue & Payne, has a tunnel 140 feet in good formation. This is an extension of the Treasure mine.

On the Anaconda mine, in Old Diggings district, Lewis & Co. are running a tunnel on a ledge that assays 8% copper.

Work will begin shortly on the long-abandoned Mt. Queen mine, near Shasta.

The Pacific M. & D. Co. have secured a bond for one year on the Spalding property, near Shasta, for $4000. A San Francisco company will develop the claim.

Redding, March 6.

The Mammoth-Garfield M. Co. proposes to sell a part of its mill site and to take over certain shares of the Alta Sierra G. M. Co., and will have a meeting at its San Francisco office on the 19th inst.

TUOLUMNE COUNTY.

(Special Correspondence).—South of the Tuolumne river the Groveland and Big Oak Flat district shows that place a favorite with mining capital. Twenty months ago there was but one mine in operation, the Kanaka; now there are upwards of twenty within a radius of eight miles of Groveland at work in a business-like manner.

At the Mt. Jefferson, Supt. J. M. Meighan, the ten 1000-pound stamp mill has been started and there is a large body of good mill rock to work on.

The Rhode Island, Supt. Sylvester Carlon, ground was broken Jan. 1st. The three-compartment shaft is sunk 110 feet. A vein prospecting well has been uncovered 60 feet on the hanging wall side, which will be caught by a crosscut on the 100-foot level as soon as the hoist is completed and machinery in place. An 85 H. P. boiler, 16x60, eighty-four flues, is on the ground.

The Mississippi at Big Oak Flat, two miles southwest, is another property belonging to the Rhode Island people. Here the hoist and machinery have been completed and are in operation. The shaft is down 110 feet. This work is in charge of William Jones of the Rhode Island, John McLaughlin having charge of the development work. The general management of this property and the Rhode Island is in charge of Sylvester Carlon. About fifty men are employed.

At the Accident operations have been

resumed after a shut down caused by lack of wood during the season of bad roads. Sinking and drifting are going on and the time when a mill will be needed approaches.

The Little Wonder, in charge of Messrs. Milligan and McCallum of a Scotch syndicate, is operating full-handed again, having just installed new hoisting machinery.

Groveland, March 1.

COLORADO.

BOULDER COUNTY.

At Boulder the Caribou mine is to be unwatered; a contract is locally reported to have been let for $60,000.

CHAFFEE COUNTY.

(Special Correspondence).—One of the greatest strikes in the Granite district was made during the past week in the Magenta mine. In the west drift, about 65 feet from the shaft, 6 to 8 inches of high-grade ore has been cut, carrying a large amount of free gold. Assay returns show a value of $280 per ton after the free gold had been extracted from the sample. This ore chute was cut at a distance of about 400 feet from the surface and, provided that the ore continues to the surface, the Magenta will be one of the biggest mines in the district.

The Belle of Granite shaft has a depth of 220 feet and has been in ore 45 feet. The pay streak averages about 5 inches and the ore being taken from the bottom of the shaft averages twenty ounces gold and from 15% to 20% copper per ton.

Granite, Colo., March 3.

GILPIN COUNTY.

At Central City Mgr. Knowles of the Crown Point and Virginia property, whose shaft buildings and machinery were destroyed by fire last week, will rebuild.

McFarlane & Co. of Black Hawk will change from twenty-five slow to twenty-five fast-drop stamps at the Wilkie mill, at Idaho Springs. A controlling interest in that property is now held by the Colorado-California Shareholding M. & M. Co.

HINSDALE COUNTY.

The Gold Run cyanide plant is to be increased to admit placing six more tanks.

The Cimarron mill will be in full operation again by April 1 with nearly double its former capacity.

LAS ANIMAS COUNTY.

Copper City, in the Carriso mining district, is attracting attention. It is fifty-eight miles from Clayton, N. M. The ore is in a banket vein of silver, copper and gold, which is said to run $150 to the ton.

OURAY COUNTY.

The Guston mine, Ironton district, is to be sold by its owners, a London company, to J. B. Hays of Pittsburg. It was formerly a profitable producer of silver, but has been shut down for some years.

SAN MIGUEL COUNTY.

The new Smuggler-Union mill is to be equipped with automatic stokers.

The Four Metals Co. will put up a mill to treat the ore from its Palmyra group. The ore in the main vein is about 3 feet wide and is said to average $200 per ton.

Work on the new mill on the Gertrude has begun.

The San Juan Gold & Silver Recovery Co., one mile from Telluride, proposes increase of its cyanide plant to 200 tons in twenty-four hours. The tailings are principally from the Smuggler-Union mill, and have been washing down and settling on the placer for the past twelve or fifteen years, and it is figured that there are between 200,000 and 300,000 tons of them. The News says tests made before the placer was purchased by the present company showed the tailings to carry from $5 to $6 per ton in gold and silver, while assays previous to that gave values as high as $14 to the ton. The company is also handling the tailings which are coming from the Smuggler-Union mills.

TELLER COUNTY.

The Altamont and Deadwood companies have consolidated. O. H. Shoup is secretary and treasurer.

The February tonnage of Cripple Creek district amounted to 41,800, of a value of $2,296,700. Following are figures of the ore treated by the various mills and smelters:

	Tons.	Average Value.	Valuation.
Arequa	2,550	$24	$61,200
Brodie.....	600	30	18,000
El Paso	3,000	30	90,000
Metallic.....	8,500	20	170,000
National.....	1,650	35	122,500
Colo.-Phila	8,500	30	255,000
All Smelters..	17,000	90	1,530,000
Miscellaneous..	....	..	50,000

IDAHO.

IDAHO COUNTY.

J. A. Wood, Supt. Iola mine, says there are 2500 feet of tunnel workings on the property. A strike has been made in the lower workings at the foot of a 100-foot shaft. There is a thirty-ton mill at the Iola. Thirty men are employed. The snowfall generally throughout that region is very light.

MONTANA.

MADISON COUNTY.

Elling & Morris propose to build a 250-ton concentrator near Perry to treat the product of the Clipper group of mines.

The Clipper at Pony is probably the deepest gold mine in the State. It is on the side of a mountain and there is a drift in from the base of the latter about 2000 feet, which gains about 1 foot depth from the surface every foot it goes in, hence has opened the mine at a depth that would require a shaft about 2000 feet deep to reach. The tunnel has advantages over a shaft as a means of drainage. The three ledges in the mines are parallel and run east and west. The ore assays from $5 upwards in gold.

PARK COUNTY.

The Montana Coal & Coke Co. and the Butte & Yellowstone Co. consolidate and will increase the number of coke ovens at Horr and Aldridge to 300.

NEVADA.

LINCOLN COUNTY.

Mgr. Dooley of the Johnny group at Stateline has decided on the erection of a new mill.

The St. George Copper M. Co. has shipped to Modena 50,714 pounds of copper ore and 8760 pounds of regulus. The smelter has closed down pending the arrival of a new water jacket.

STOREY COUNTY.

The fact that there is a standing offer of $8000 for the machinery at the Alta mine, while the entire stock at the present quotations represents a total value of only $4000 for the property, is to the Virginia Chronicle another illustration of the vagaries of mining stock speculation. The Alta machinery includes a fine steam hoist pump—the best pump plant on the lode—and a 20-stamp mill, all in first-class order and costing originally over $250,000. The Alta shaft was sunk to a depth of 2180 feet, developing large bodies of low-grade ore in explorations on the lower levels. The fact that after the suspension of pumping in the Yellow Jacket and other Gold Hill mines the pump plant at the Alta demonstrated that it could hold the water, unaided, down to the 2150 level practically illustrated its efficiency. The total assessments levied by the Alta Co. to date approximate $4,000,000, of which $300,000 was paid for the Lady Washington, Keystone and ground claimed by the Justice Co.

WASHOE COUNTY.

W. D. Linton is shipping limestone for flux to the Reno Reduction Works, which are locally credited with "turning out 1000 pounds of bullion per day."

NEW MEXICO.

SANTA FE COUNTY.

Supt. Bigot of the Ortiz mine, Dolores, reports resumption of work. The shaft is down 430 feet. Ore running $3 to $50 per ton is being treated. Mr. Bigot was recently held up on his way from Dolores to the Santa Fe Railroad and a 51-ounce gold brick taken from him by a masked robber.

OREGON.

BAKER COUNTY.

J. C. Young of Sumpter says within three years thousands of miners will be at work all the way from Sumpter to Prineville.

Mgr. Hayes of the Bonanza mine declines to verify the statement that the mine has been sold to Eastern men for $1,500,000.

LINN COUNTY.

The Champion mine, Bohemia, is sold by the Hartford M. Co. of Chicago to Benham & Alkins of Tacoma, Wash., for $30,000.

UTAH.

PIUTE COUNTY.

(Special Correspondence).—The Dalton mine, under the management of O. R. Young, of Salt Lake City, has about 2500 feet of development, divided among tunnels, shafts and winzes. While not yet a regular producer, the Dalton has uncovered some good ore, bearing gold, silver and lead.

Marysvale, March 2.

SUMMIT COUNTY.

(Special Correspondence).—The Ontario is now operating with a force of 170 men at the mine and about fifty men at the Marsac mill, which is running on Ontario ores. At present over 100 tons per day are hoisted through the No. 3, or main working shaft, which sinks 1500 feet vertically in proximity to the mineralized fissure. The vein dips westward and the position of the shaft is such as to strike the vein at the 1500 level. At each 100-foot station crosscuts connect the shaft with the ore body. On the latter there are from 3000 to 4000 feet of drifting at each corresponding level. The 600-foot level constitutes what was originally drain tunnel No. 1, which runs northward from the shaft, coming to the surface in the gulch below; it also extends southward, through the grounds of the Daly mine, and connecting with the Daly-West still farther on, making a tunnel about three miles in length. It forms the 600 level in the Ontario, the 800 in the Daly and the 1200 in the Daly-West. It now carries no water, but is used solely for ore transportation. Cutting under the Ontario workings, a few feet below the 1500-foot level, is the great Ontario drain tunnel, running eastward from the western section of the Ontario grounds, emptying a great volume of water into a depression three miles east of the Ontario shaft, and is four miles from head to discharge. This drains the greater area of Park City district and was completed in 1893. For ten years previous to the latter date, a great pumping engine, having one 38½-inch high-pressure and one 70-inch low-pressure cylinder, with 10-foot stroke, operating a double line of 20-inch pumps, lifted 2500 gallons of water per minute, requiring over 100 tons of coal per day for power; and yet those facilities were not adequate to cope with the surfeit of water. But in those days the ores averaged about 150 ounces silver to the ton, with good lead values added. The ores carrying such values were found from the surface down to the 700 and 800-foot levels and along the strike of the vein for 2000 and 3000 feet. While these upper levels are still shipping some ore, they are pretty well stoped out.

The main production at present comes from the stopes from the 9th to the 15th level. The workings from the 10th level upward connect with the Daly workings on the south, and the drifts on the 12th, 14th and 15th are being pushed for similar connection. The main fissure narrows in some places and widens in others, carrying streaks of irregular width and varying value; and there are offshoots and deflections from the main ledge, and there are parallel veins. The system of timbering in the stopes is necessarily one of adaptation to the peculiar forms of ore bodies. The milling ores now being produced are said to run about forty ounces in silver and not high in lead; the shipping ores run about seventy ounces silver and 10% lead, with small values of copper and gold.

In the shaft house a suction air pump operates, carrying the foul air from each level through sheet-iron pipes, thus creating a circulation that supplies the mine with good air.

The Marsac mill, operating on Ontario ores, has crushers, a battery of thirty stamps, revolving driers, Stetefeldt roasting furnaces, the fuel being supplied by a Taylor coal gas producer. The ore, crushed to a fine mesh, passes through driers and is elevated and fed to the furnaces through automatic, sifting feeders. The material passes from the furnace in the form of a chloridized pulp, which is then subjected to the various methods of leaching and chemical action prescribed by the process, which includes solutions of hypo-sulphite of soda and hypo-sulphate of copper, the final product being a sulphide of silver, which is turned over to the refinery, an adjunct of the same mill. About sixty-five tons of ore per day are milled. It is estimated that Ontario underground workings aggregate forty-five miles of tunnels, drifts, upraises and stopes one set high.

The Silver King is about two miles west of the Ontario, its surface improvements being in a separate canyon basin. The ore here is a silver-lead carbonate in some sections, with large bodies of galena in others. The ore body is in the form of a rather flat ledge, between a lime hanging wall and a quartzite foot wall. The mine is opened through a 1300-foot vertical, three-compartment shaft, from which levels run to the ledge at 700, 900, 1000 and 1200 stations, the vein being of sufficient inclination for this plan of work. On the 9th level, which I went through, the work was extensive, the face of ore being four sets high in places, though the same was interspersed here and there with small barren strata. The ore being produced here is a carbonate, in the main, but with bunches of galena of varying sizes all through. The ore is classified as it is broken, the first grade being for shipment direct to the smelter and the second grade being sent down to the ore bins at the mill. Similar production likewise goes on at the 7th, 10th and 12th. On the 13th level the work of development and exploration is in progress.

A covered tramway track leads from the shaft house a few hundred feet to the ore bins, the latter having a capacity of 2500 tons. There are twenty-one compartments, each one terminating in a chute, below which ore cars are loaded and dumped into the two Blake crushers on the top floor of the mill. From here the material works its way automatically down through the mill, resulting in a fine concentrate on the lower floor. Below the crushers are two sets of Cornish rolls, 14x36; two sets of fine rolls of same dimensions; revolving screens which separate the fine from the coarse before passing to the sixteen jigs. From the jigs the material is carried to the finishing rolls through six perpendicular elevators. It is then fed through 5-foot Huntington grinders, of which there are four. A large proportion of the jig product—that containing the heavy lead values — is shipped to the smelter in that form. The balance passes through the Huntingtons, as above stated. On the lower floor are six Wilfley tables for the coarse work and five Frue vanners for the finer product. But just above the vanner floor is a hydraulic classifier, 60 feet long, divided into ten compartments. This receives the product of the Huntingtons, sizing it to different grades from 18 to 200 mesh, adapting it to the different tables, each of which is set for a particular grade of work. The classifier mentioned was designed by J. B. Fleming, mill superintendent, under whose directions the entire mill equipment was set up. The slime tailings from the concentrators pass to twenty-seven canvas tables, each 55 feet long and 2 feet wide, on which a substantial saving is made. The mill, which has a capacity of 250 tons of ore per day, has a boiler force of 250 H. P., a cross-compound Corliss engine of 150 H. P. At present only about seventy-five tons per day are being milled, about eighty tons per day going to the smelter direct. The smelting ore runs from 40% to 45% lead and fifty to sixty ounces silver, the milling ores running from 18% to 20% lead and an average of twenty ounces silver per ton. The concentrates run about 45% lead and fifty to fifty-five ounces silver. The January shipments amounted to 4,878,940 pounds of crude ore and 1,066,650 pounds of concentrates. It will be seen from the above that the Silver King is not only a rich producer, but has one of the largest and most thoroughly equipped concentrating mills in the country.

The Daly-West shaft house is 600 feet higher in elevation than that of the Ontario. At the former is a Bullock hoisting engine, 20-inch diameter by 60-inch stroke; and an Ingersoll air compressor, duplex, tandem, with 16x42 cylinders. The Daly-West shaft is double-compartment, vertical, and 1400 feet deep. Levels run to the vein at the 900, 1200 and 1400-foot stations. At the 900 station the ore body is found 275 feet to the west, at the 1200 it is 500 feet from the shaft and 700 feet from it on the 1400 level. The position and structure of the ledge resembles that of the Silver King, being greatly flattened in most places and between quite similar walls; but the ores in the Daly-West are mainly sulphides, carrying silver, lead and some zinc—there being practically no carbonates, as are found in the Silver King. The Daly-West high-grade ores come mostly from the 900-foot level, running from 22% to 25% lead and from sixty-one to sixty-eight ounces silver. These ores are brought to the shaft in cars and sent down to the 1200-foot level, thence hauled to the surface through the tunnel which passes from Daly-West grounds, through the Daly and Ontario to the railroad track in the upper part of Park City, a distance of three miles. The milling ores come chiefly from the 1200 and 1400 levels, are hoisted to the surface and run through the mill, which is located near the shaft house. The mill product is a silver-lead concentrate that runs 25% to 30% lead and forty-five to fifty ounces silver. The mill is equipped with crushers, rolls, jigs, revolving sizers, classifiers and ten Wilfley tables. Over 100 tons per day are milled and 75 tons per day are shipped to the smelter. The concentrate shipments amount to about thirty tons per day. The workings in the mine are extensive, by which it is seen that the ground worked out has contained great masses of ore and that the same solid ledges are exposed at the face of the work on all three levels and in the stopes. Within the past year 7792 tons of ore were sent to the smelters, returns from which were 495,484 ounces silver, 3,988,891 pounds lead, 461,288 pounds copper and 406 ounces gold, of the total value of $334,445. At the mill 17,169 tons were reduced to 4785 tons of concentrates, the latter containing 33% lead, forty-nine ounces silver to the ton, selling for $194,-571. The gross proceeds of the year were $549,721, the expenditures for labor and supplies amounting to $171,801, leaving net proceeds of $377,911.

The Anchor joins the Daly-West on the west, the shaft house of the former being several hundred feet higher than that of the latter. The Anchor shaft sinks 1600 feet. On the 1200 level a tunnel runs 1¼ miles to surface at a point down the gulch where the Anchor mill is located. All the Anchor ores now pro-

duced are milled, being hauled out through the tunnel. An upraise from the 1200 level, on an incline 400 feet long, to the seventh level, is all that distance in ore. A large amount of stoping has been done between the thirteenth and fourteenth, an incline connecting these two levels on the vein. The vein on which the upraise runs is a different one from that opened on the thirteenth. The former dips to the south and the latter to the north. The mill handles about 2400 tons of ore per month, the product being 600 tons of concentrates. The ores are a sulphide of iron, lead, zinc and copper, the concentrates running 45% lead. The mill equipment is quite similar to that of other mills described.

In general, Park City district employs about 1000 men in the mines and mills; ships 6000 to 7000 tons per month, three-fourths of which is crude ore and one-fourth concentrates.

The Rio Grande Western Railway Co. are changing their Salt Lake–Park City line to a broad gauge, building 6½ miles of new track near the summit, to reduce the grade so that it will not exceed 4% at any point. Instead of crossing the summit at the elevation of the old roadbed, the new track will pass through a 1200-foot tunnel 175 feet lower. WASCOTT.

Park City, Feb. 24.

TOOELE COUNTY.

(Special Correspondence).—Dry Canyon Camp: The Mono mine produced heavily in early days. The old workings consisted of an incline shaft 900 feet deep. A tunnel is being driven to cut the ore body below the old workings. It is in 2400 feet. The ores carry lead and horn silver and probably some telluride of gold. Shipments consist of an occasional car of ore. It is owned by M. Gisborn of Salt Lake City.

The Treasure is likewise an old timer and has an 1800-foot incline shaft, with some drifting therefrom, to show for its former activity. It is now in the hands of lessees.

The Kearsarge, also worked by leasers, is shipping some high grade ore, carrying gold, silver and lead.

The Mammon, worked by W. C. Reynolds, G. Brande and others, recently shipped ore running $90 per ton.

The Utah Queen, sold two months ago by G. Cameron to a company managed by F. Morehouse of Salt Lake City, brought $40,000. It is shipping some ore that runs well in silver and lead.

The Hefner tunnel, owned by Garber & Hamilton, is being run to tap the Queen of Hills mine, which they also own. They are developing and blocking out ore and are said to ship enough to pay all current expenses of the properties. The tunnel, in 1100 feet, has cut four ore shoots. It is a silver-lead proposition. WASCOTT.

Dry Canyon, Feb. 21.

UINTAH COUNTY.

The group of gilsonite claims upon the Utah–Colorado boundary line is sold by Mgr. Seaboldt to Eastern investors for $200,000.

UTAH COUNTY.

Owners of mining claims near Alpine have grouped their claims and incorporated under the name of the Pacific M. & M. Co.; capital stock, $20,000; 200,000 shares. O. Hudson is Mgr.

WASHINGTON.

FERRY COUNTY.

J. Cody, Supt. Flagstaff G. M. Co., operating the El Capitan mine at Cody, says his samples runs from $1.03 to $6.10 a ton gold.

WYOMING.

W. E. Cody—"Buffalo Bill"—says that he and Gen. Miles will put in a $1,000,000 smelter at Grand Encampment.

CARBON COUNTY.

The chief officials of the Standard Oil Co. are locally alleged to be the new purchasers of the Ferris–Haggarty copper mine, Battle Lake district. They are represented to intend to pay the present owners of the mine $1,500,000 this month.

FOREIGN.

AUSTRALIA.

NEW SOUTH WALES.

The semi-annual report of the Broken Hill Proprietary to Jan. 1st, 1900, shows that the gross profit for the half year amounted to £144,492 12s 2d, which, after deducting £34,130 7s 9d for depreciation upon the various plants, left a net profit of £110,362 4s 5d. The sum of £62,935 1s 9d was expended in construction, and two dividends, each of 1s per share, or £96,000 in all, were distributed. After making due provision for all outstanding liabilities there remain assets in cash, bullion and other convertible stocks to the total value of £426,359 13s 11d. The output of silver was 2,502,463 ounces fine, against 2,218,234 ounces for the previous half year, and of lead 17,831 tons, as against 17,823 tons for the former period. At Port Pirie the tonnage of ore, concentrates, etc., smelted, amounted to 95,154 tons, as compared with 100,064 tons in the previous half year. This yielded an average of lead 18.48 units per ton, silver 22.68 ounces per ton. The refinery treated 18,980.25 tons of silver-lead bullion, producing silver, fine, 2,568,566 ounces; gold, fine, 9675.88 ounces; soft lead, 18,240.15 tons; antimonial metal, 303,72 tons, and by-products containing lead 1.55 tons. The gold parting plant treated 361,249 ounces dore silver, from which were separated 9675.88 ounces fine gold.

BRITISH COLUMBIA.

In London is formed an association of British companies owning mines in the Slocan district to act with the Silver-Lead Mine Owners' Association, the English organization insisting upon the reopening of the mines, concessions to be made the British shareholders tiring of the strike, with its resulting absence of dividends.

MEXICO.

(Special Correspondence).—At the property of the Guanajuato Con. M. & M. Co. of Guanajuato the output of the mine is averaging $22,000 per month. The intention is in a short time to double the capacity of the mill. The underground workings in the Sierra mine measure between 35,000 and 40,000 feet, with a working tunnel 12x14 5500 feet in length.

Guanajuato, Feb. 20.

J. H. Wood, secretary Cobre Grande Copper Co., Phœnix, Arizona, says: "The Cobre Grande Copper Co. is the owner of the producing copper mines and smelter in the Cananea mountains, Sonora. The company has paid and deposited in the Mexican courts $50,000, and is obligated to pay the balance. No part of the purchasers' contract obligation is in default."

Two Republics: According to the official organ of the State of Guerrero, W. Hughes, agent for R. E. Briggs, Mexico City, has denounced a gold, silver and copper bearing ledge, to which he has given the name of La Alta, in the vicinity of Totolapan, district of Coyuca, near the Mexico, Cuernavaca & Pacific Railway. ——The National Mexican M. & D. Co. has organized to work the El Plomo group in the district of Altar, State of Sonora. W. Jackson represents the company at Altar.

THE KLONDIKE.

The Yukon Sun, Dawson, Feb. 6, says that the cleanup this spring on Sulphur creek will amount to $2,000,000. It gives account of claims being worked from the 70 above Discovery to 33 below. Many steam thawers are going and dumps had been formed up to that time amounting to 14,000 buckets.

Industrial Notes.

—An electric power plant is to be installed on the McCloud river, Shasta Co., Cal., twenty-two miles from Redding.

—Baker City, Or., will receive sealed proposals until May 1 for gravity water bonds, to the amount of $100,000, to run twenty years at 5%.

—There are 6 iron foundries in Arizona, 88 in California, 30 in Colorado, 4 in Nevada, 6 in Oregon, 3 in Idaho, 8 in Montana, 22 in Washington, 12 in Utah.

—At Frisco, Colo., Ault & Wiborg of Cincinnati, owners of the Excelsior mine, will put in a 3000 H. P. electric plant to supply light and power to the mine.

—The world's production of pig iron in 1899 was 40,560,000 metric tons; 36,507,487 tons in 1898. The United States now stands at the head of all nations as an iron producer.

—The Mexican Central Ry. was able to show fixed charges earned for 1899 by reason of the advance in silver; had the price of silver in 1899 been the same as in 1898 the net result in gold would have been a deficit of $60,000, instead of a surplus of $99,000.

—The C. P. and later the S. P. Ry. has been using a circuitous route around Great Salt Lake, Utah, for thirty years. Survey is now being made for a cut-off across the lake from Lucin to Ogden, Utah, to connect with the old S. P. line at a point just north of the Ogden river. The cost will be considerable, involving building a steel bridge 19½ miles long upon piling driven into the bed of the lake, some necessarily 50 to 80 feet in length.

Books Received.

"The Ore Deposits of the United States and Canada," Jas. F. Kemp, 3rd edition, pp. 480, an enlarged and rewritten edition of a work that has already had deserved sale, and a book that can be recommended. As will be noted, the scope of the work now includes Canada, the Yukon region being given attention; The Scientific Publishing Co., N. Y. City; $5.

Personal.

J. J. CRAWFORD has returned to San Francisco from Placerville, Cal.

H. P. GORDON has charge of a mine at Plymouth, Amador county, Cal.

W. W. ALLIS, Pres. E. P. Allis Co., Milwaukee, Wis., is visiting San Francisco.

H. C. WOODROW has bonded the Texas mine, Shasta county, Cal., and has gone to Boston for capital to take up the project.

J. H. CONRAD is inspecting the Madisonian mine at Norris, Montana, for the Leiters of Chicago, who have an option on it.

G. P. KELLER, maker of the Keller assay balance, has opened a shop in Salt Lake City, Utah, to enter business for himself.

T. H. SIMMONDS, formerly Supt. Empire mine, Grass Valley, Cal., will start with his family for a tour in Europe about March 15th.

PAUL E. JOHNSON is at Madera, Cal. He says the B. C. Copper Co.'s smelter at Greenwood, B. C., will blow in about Aug. 1, 1900.

JOHN HARNAN, recently of the Portland G. M. Co., Colorado Springs, Colo., is Gen. Mgr. Colorado & Deadwood M. Co., Deadwood, S. D.

T. W. BROOKS, Pres. Yuma & Colorado R. G. D. Co., is in San Francisco to buy dredging machinery for his property near Yuma, Arizona.

S. H. JOHNSON JR., who has been experimenting with the bromo-cyanide process at Republic, Wash., is in San Francisco, en route to London.

GEO. BAYHA, Pres. North Cal. Investment Co., developing extensive copper properties at Stillwater, Cal., is on a visit to the mines from Cologne, Germany.

CHARLES KIRCHHOFF of New York will have charge of the statistical work in connection with the smelting and refining of metals for the Twelfth U. S. Census.

C. DOBBELSTEIN, Gen. Mgr. Gray Rocks copper mines, Stillwater, Cal., returned to the mines last week from Sutter Creek, Cal., after an examination of the Baliol mine.

SENATOR E. W. CHAPMAN of Placer county, Cal., is spending considerable time at present in superintending his gravel properties near Placerville, El Dorado county, Cal.

H. O. KIRK, representing the Westinghouse Electric Co., is en route to Kobe, where he will represent his company in Japan, Siberia, Korea, China and the Philippines.

P. S. LOZANO of Placer county, Cal., is in Sonora, Mexico, to examine and perfect title to copper properties in which he is joint owner with A. L. Smith, S. Bartlett and others of Auburn, Cal.

PROF. A. VAN DER NAILLEN, who has been for nearly thirty years at the head of his San Francisco school, has gone to Paris, to remain during the Exposition, to note anything new in the mining and engineering line.

PROF. HOBBS thinks it not improbable that when the territory about Hudson's bay is thoroughly explored, a region for profitable diamond mining may be found. He says the soil and geological formation in the Hudson's bay district are decidedly diamondiferous. Some of the stones found have gone as high as 24 carats.

Recently Declared Mining Dividends.

United Verde Copper Co., Arizona, 50c a share; Feb. 27.

Empire State, Idaho, M. & D. Co., monthly dividend, 3%; payable March 15.

Cordeil Zinc & Lead M. Co., monthly dividend, 5c per share; payable March 15.

Wolverine M. Co., Mich., semi-annual dividend, $2 per share; payable April 2.

Daly-West M. Co., Utah, 25 cents per share; payable March 15.

Centennial Eureka M. Co., Utah, final dividend, $16,500; payable March 15.

Commercial Paragraphs.

THE Jeanesville compound condensing pump in the Ibex mines at Leadville was built 15″ and 28″x9″x36″ for 600-foot lift. The mining company reduced the water plungers to 7½″ and put the pump on the 1100-foot level. It is now pumping water 1100 feet, direct lift. It is the highest direct lift now in use in Colorado. It is performing the work with eighty-five pounds steam. A duplicate of this pump, 13″ and 24″x7″x24″, in the Vindicator mine at Independence, Colorado, is pumping 800 feet.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING FEB. 27, 1900.

644,503.—INSECT DESTROYER — F. Dayton, Portland, Or.
644,284. — HORSESHOE — C. G. DeLay, Murphy, Cal.
644,064.—SCHOOL DESK — W. T. Dodd, Walla Walla, Wash.
644,286.—NAIL—J. T. Eyster, Eagleville, Cal.
644,289. — CONCENTRATOR — G. Gates, Jackson, Cal.
644,513.—SOAP HOLDER—W. R. Hall, S. F.
644,521.—DREDGER—D. Jordan, S. F.
644,210.—LOOSE LEAF LEDGER—E. L. McClure, S. F.
644,255.—LOCK—J. C. Meyer, S. F.
644,534.—TONGUE SUPPORT—J. J. Nagley, Marysville, Wash.
644,366. — JOURNAL BEARINGS — A. Newell, Pasadena, Cal.
644,448.—CIRCUIT CLOSER—Nye & McIntosh, Los Angeles, Cal.
644,457.—DREDGER—W. B. Pless, S. F.
644,459.—FISH TRAP NET—T. Redding, Seattle, Wash.
644,450.—INK BOTTLES—E. J. Robinson, Santa Monica, Cal.
644,153.—HOOK AND EYE—A. T. Snell, Los Angeles, Cal.
644,114.—CURTAIN POLE—A. S. Venen, Forest Grove, Or.
644,389.—COIN OPERATED MACHINE—J. L. Wilson, Los Angeles, Cal.
644,390.—COIN OPERATED MACHINE—J. L. Wilson, Los Angeles, Cal.
644,268.—REFRIGERATOR CAR — J. Zobrist, Hanford, Cal.
32,274.—DESIGN—H. L. King, Spokane, Wash.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PLOW.—A. G. Carter, Fresno, Cal. No. 643,838. Dated Fed. 20, 1900. This invention relates to improvements in plows. It consists of a frame mounted upon wheels, carrying the plate or cultivating mechanism, with a means for operating the same. A boom has one end connected with the frame, and extends to a distant center with which it is connected, and about which it and the plow frame are caused to to move alternately from one end to the other of its arc of travel. An engine or motor is carried upon this center of motion, and power from this engine is transmitted to actuate the plowing mechanism and cause it to traverse the arc which is transverse to the line of travel of the machine as it progresses from one end of the field to the other. When the plows have traveled through this arc, the driving mechanism is reversed and the plow starts back on its arc of travel just overlapping the arc which has previously been plowed. In this manner a width of ground, nearly double the length of boom, can be plowed during the advance of the engine across the field, and thus a comparatively light engine or motor can be used on soft or marshy land because the engine itself remains stationary while its power is being applied to drive the plows while making their cut, and the forward movement of the engine takes but little more power than is necessary to move itself.

QUICKSILVER FURNACE.—H. C. Davey, Calistoga, Cal. No. 643,839. Feb. 20, 1900. This invention is designed to extract quicksilver and that class of metals from its ores. In the wresting of quicksilver ores, it has been customary to place the ore in the roasting furnaces so that the moisture from the wet ore is expelled from the same exit with the fumes arising from the roasting of the ore, and result has been a very considerable loss of quicksilver on account of the vapors of the quicksilver being carried off by the escaping watery vapor and the formation of mercury soot or acid compounds which make it difficult to properly condense and save the mercury. In some cases the ores have been dried upon exterior tables, and have been placed in the furnace, but this does not avoid this difficulty, since the ore will absorb some moisture from the atmosphere before it goes into the roasting portion of the furnace. In my invention I have formed my furnace with an upper drying chamber, and a lower roasting chamber with direct inter-communication, so that the ore, after being thoroughly and per-

fectly dried at a comparatively low temperature, passes directly into the roasting portion of the furnace, where it is exposed to the higher temperature necessary to separate metal from its combinations.

FARE REGISTERS.—J. G. Miller, San Francisco, Cal. No. 643,879. Dated Feb. 20, 1900. Registering devices are employed upon street cars to indicate the number of fares, tickets, transfers or other representative of money received or for counting and other like purposes where it is desired to keep a registration of all transactions. In the use of such devices upon street cars it is difficult to keep the accounts of various conductors in proper shape, because the conductors are frequently transferred to different cars while the register remains upon the car. It is therefore necessary to take the amount shown by the register whenever a conductor leaves the car and a new one comes on, and at the end of the day it is also necessary when the car goes to the stable to take the final registering of each car as it comes in. The object of this invention is to simplify this matter by providing each conductor with a total register which is adapted to be connected with any of the registering apparatus of any of the cars of the line upon which he is employed, so that he can insert the device and connect it with the permanent mechanism on the car when he starts, and when he leaves the car he can disconnect it and take it with him to the next car, each conductor thus taking his own record with him throughout the day and turning it into the office when his work ceases.

FEEDER FOR THRESHING MACHINE.—James L. Patterson, Madera, Cal., and George T. Hill, Merced, Cal. No. 643,849. Dated Feb. 20, 1900. This invention is for an apparatus which is designed to feed unthreshed straw to the threshing cylinders in that class of machines. It consists of a series of superposed guided boards or fenders standing in inclined planes in a guided case and extending entirely across from side to side of said casing, these boards being connected with oppositely movable cranks whereby the boards are alternately reciprocated in their different planes of motion, and in connection with these are means whereby the straw delivered into the upper part of the machine is gradually moved down and fed continuously to the threshing cylinder by the oppositely reciprocating movements of the feeders.

Latest Market Reports.

SAN FRANCISCO, March 8, 1900.

SILVER—Per oz., Troy: London, 27⅛d (standard ounce, 925 fine); New York, bar silver, 59⅝ cts. (1000 fine); San Francisco, 59⅜; Mexican dollars, 48½c.

The following table shows the amount of gold and total money in circulation at the beginning of each half of the fiscal year from July 1, 1896, to Jan. 1, 1900:

Date.	Gold (coin and certificates) in circulation.	Total money in circulation.
1896—July 1..	$498,449,242	$1,509,725,200
1897—Jan. 1..	555,630,668	1,650,223,400
July 1..	556,432,594	1,646,028,246
1898—Jan. 1..	584,126,049	1,721,100,640
July 1..	696,780,519	1,843,435,749
1899—Jan. 1..	732,980,132	1,897,301,412
July 1..	734,716,728	1,932,484,239
1900—Jan. 1..	779,100,627	1,980,398,170

It is stated to be the intention of the U. S. Treasury Department, as soon as the pending financial bill becomes a law, to expedite as fast as possible the coinage of the silver bullion purchased under the Sherman Act still remaining in the treasury. There is still on hand bullion purchased under this Act costing $78,000,605, and represented by that amount of treasury notes outstanding. The department has been coining this bullion into dollars at the rate of $1,800,000 a month. The financial bill authorizes the coinage of enough of this bullion into subsidiary coins to bring the total subsidiary coinage up to $100,000,000. This will require about $25,000,000 in subsidiary coins. In addition to this the department proposes to increase the coinage of silver dollars to $4,000,000 a month, and the effect will be to have all this bullion coined and all treasury notes retired within a year and a half.

SMOOTH-ON CASTINGS.

An iron cement in powdered form, for repairing leaks or fractures in steam or hydraulic work, applied by mixing with water; hardens quickly and expands in hardening. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

MESSRS. MADISON, BRUCE & SELLERS,

STEAM LOCOMOBILE FREIGHTING TRAIN.

CAPACITY OF WAGONS 16 TONS EACH, or total freight carrying capacity of train 50 tons.

CAPACITY OF ENGINE, 50 H. P.

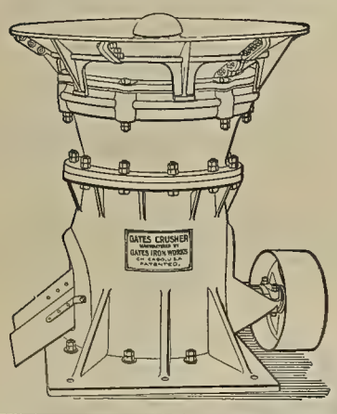
THESE WAGONS ARE ESPECIALLY DESIGNED FOR STEAM FREIGHTING.

CAPACITY OF TRAIN, 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the world. Eighty of them in use on this Coast. They are being Successfully and Profitably Employed in Hauling Logs, Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend grades as much as 10% to 20%, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on a firm and moderately level road.



Send for descriptive Circulars and Price List of Engines and Wagons. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address

THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

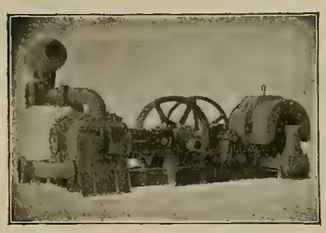
THE : CAMMETT : CONCENTRATOR.
Designed with some Regard for the Laws of Concentration.

We have reports from mills employing Cammett concentrators for the treatment of ores containing galena, iron sulphide and zinc blende, that they are regularly producing on each table three distinct concentrates—one of galena, one of iron sulphide and one of zinc blende, each of which is commercially clean.



Practical experience with the Cammett concentrator proves that it **saves** and **delivers** into the **concentrates box** slimes so fine that to prevent them from being lost from the **concentrates box** it is necessary to provide several additional overflow tanks.

Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

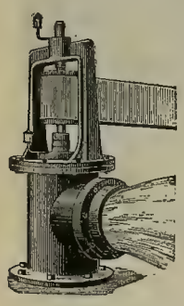
30in. x 72in. Direct Acting Hoisting Engine

BUILT FOR THE

Anaconda Copper Mining Company

OF MONTANA.



Embodying all that experience and practical working have demonstrated as valuable in this class of machinery.

The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

RIVER BOTTOMS.

Wood's Propeller Pump

Is the most rapid, convenient and efficient, and often the only practical means for pumping out river bottoms. Durable, reliable and compact. Send for catalogue, and get our estimates on pumps for all kinds of pumping. JUST THE PUMP FOR CAPE NOME.

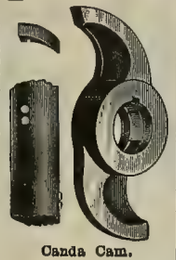
L. G. Harrison,

31 MAIN STREET, - - - - SAN FRANCISCO, CAL.

WHERE ONE OF THESE PUMPS IS IN PRACTICAL OPERATION.

ADAMANTINE SHOES AND DIES.

++++++CHROME CAST STEEL.++++++



CANDA Improved Self-Locking CAMS.

TAPPETS, BOSSES, ROLL SHELLS AND CRUSHER PLATES.

These castings are extensively used in all the mining States and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to the above conditions. When ordering, send sketch with exact dimensions. Send for Illustrated Circular.

Manufactured by **CHROME STEEL WORKS,** Brooklyn, N. Y.

Canda Cam.

THE

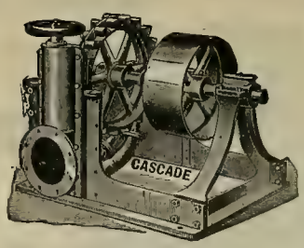
Pelton Water Wheel Company

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods. An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,

Averaging some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.



Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

The Pelton Water Wheel Company,

121 & 123 MAIN STREET, SAN FRANCISCO, CAL.

TURBINE AND CASCADE WATER WHEEL

Adapted to all Heads from

3 Feet to 2000 Feet.

Our experience of 38 YEARS building Water Wheels enables us to suit every requirement of Water Power Plants. We guarantee satisfaction.

HENRY DEMMERT.

CANTON STEEL.

For hard rock mining we recommend **Canton Extra Drill Steel, Warranted.** This steel will be found superior to all other American brands both in toughness and durability.

Equal to Jessop's or Firth's in Hard Rock.

FOR SALE BY
SCHAW, INGRAM, BATCHER & CO, SACRAMENTO AND SAN FRANCISCO.
HARPER & REYNOLDS CO., LOS ANGELES.

PORTLAND,

Colorado's Great Mine.

"We have used **Canton Extra Drill Steel** on our property for **four** years, same giving us satisfaction at all times. We can sincerely say it is **the best steel for drilling hard rock.**" W. F. DECAMP, Superintendent.

FIRTH'S DRILL STEEL, 16 cents per pound.

The best drill steel on the market. Has no equal for hard rock drilling. Miners cannot afford to use an inferior steel when FIRTH'S can be bought at the above price.

ASSESSMENT NOTICES.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of February, 1900, an assessment (No. 15) of Ten ($10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 12th day of March, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 3rd day of April, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

SIERRA NEVADA SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of February, 1900, an assessment (No. 118) of 15 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 14, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on Tuesday, the 13th day of March, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of April, 1900, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. L. PARKER, Secretary.

Office—Room 14, Nevada block, No. 309 Montgomery street, San Francisco, California.

CENTRAL EUREKA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sutter Creek, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of February, 1900, an assessment (No. 14) of 3 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 9, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of March, 1900, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 9th day of April, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

WM. A. M. VAN BOKKELEN, Secretary.

Office—320 Sansome street, room 9, San Francisco, California.

CONSOLIDATED CALIFORNIA AND VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of March, 1900, an assessment (No. 15) of twenty cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room No. 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of April, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 1st day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room No. 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

DELINQUENT SALE NOTICE.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, 217 Sacramento street, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 22) levied on the 25th day of January, 1900, the several amounts set opposite the names of the respective shareholders, as follows:

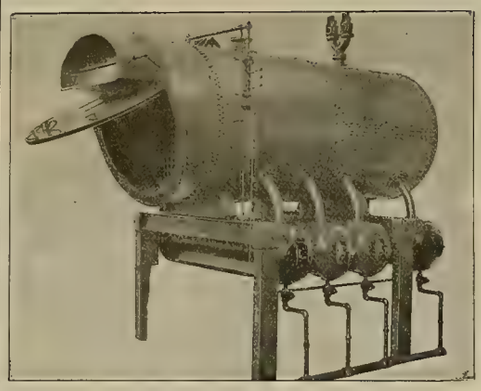
Name.	No. Cert.	No. Shares.	Amt.
P. A. Wagner, Trustee	90	980	29 40
P. A. Wagner, Trustee	92	1,000	30 00
P. A. Wagner, Trustee	93	1,000	30 00

And in accordance with law, and an order of the Board of Directors, made on the 25th day of January, 1900, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 217 Sacramento street, San Francisco, California, on MONDAY, the 19th day of March, 1900, at the hour of 2 o'clock P. M. of said day, to pay delinquent assessments thereon, together with costs of advertising and expenses of the sale.

CHAS. BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

THE
Little Alaska Gold Washer.



Weighs only 7½ lbs.; crated for shipment, 11 lbs. One man can wash five tons per day. It requires very little water, and saves more gold than any other washer. In working, the operator does not have to wet his hands, and can stand in an upright, natural position.

Just the Washer for Cape Nome.

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

AND PACIFIC ELECTRICAL REVIEW.

No. 2071. — VOLUME LXXX. Number 11. SAN FRANCISCO, SATURDAY, MARCH 17, 1900. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Smuggler-Union, Colorado.

Prior to the advent of the Tomboy mine, the Smuggler–Union was the great mining property of San Miguel county, Colo., and for many years the fame of Telluride rested upon its output. The great Smuggler vein has been noted for twenty years, and since 1883 the property has been in continuous and profitable operation, contributing an annual average of half a million dollars to the amount distributed among the wage earners of the thrifty little town of Telluride. Through the years the owners of the property showed their faith in its permanence by buying or absorbing the adjacent claims and locations, and in 1891 the present Smuggler-Union Company was organized. In April, 1899, a controlling interest passed into the hands of the New England Exploration Company, a Boston corporation, that is a large owner in the Calumet & Hecla, the purchase price being on a basis of $3,000,000. The new owners have spent considerable money, and have built a mill at Pandora, a view of which is given herewith, that, in structure and equipment, is deservedly referred to with pride by that entire section as among the finest establishments of its kind in the world. As an instance of its quality, it may be stated that the foundation walls, alone, cost $30,000; the mill represents an outlay of about $250,000. The capacity of the Smuggler–Pandora mills is 500 tons per day. A technical description of the mine, the mill, the character of the ore and manner of treatment has already been given; reference is here made to illustrate the progress of mining and scientific development, where in what was once considered inaccessible fastnesses of the Rocky mountains, the courage, skill and intelligence of the American miner—a fine combination of Western pluck and Eastern capital—has made possible the creative development of so fine a paying property, aiding in the support of a typical American mining community, this one mine, alone, furnishing steady employment to over 500 men. The Smuggler–Union is illustrative of what may be similarly developed all over the great State of Colorado, which last year produced gold to the amount of $33,000,000 and expects to increase that amount added to the permanent wealth of the world in 1900. The yield of the Smuggler–Union for 1897 was $540,806.85; for 1898, $577,943.21; for 1899, $604,328.91. Manager Collins says he considers the Smuggler–Union "the making of one of the biggest mines in the world," which illustrates the hopes of the company as to its output for 1900. To the enterprising Journal, of Telluride, we are indebted for the use of the handsome engraving that depicts the largest mineral producer of San Miguel county.

The Smuggler-Union Mills at Pandora, San Miguel County, Colorado.

To the right is the new mill, in '99 the finest in Colorado: to the left is the old mill. The white building in the center is the company's offices. Up the gulch, in the center of the picture, one mile in a direct line, is the old Bullion tunnel, the entrance to the main workings.

THE maximum output of gold, silver and copper has not been reached. The business yearly becomes more systematized because of the advent of branch railroads, the steady supply of needful articles, the progress in scientific mining and scientific metallurgy, decreased cost in price of living, improved and cheaper mining appliances, the placing of the business of mining in front of the gamble in it, and the constant attraction of men of energy and capital to a business that offers such profitable result.

Patents for Pacific Coast Inventors; Notices of Recent Patents, 296.

THE present tendency of modern metallurgy is to pay greatest attention to the profitable treatment of low-grade ore that occurs in considerable quantity. Time was when only high-grade ore was considered worthy consideration; now, such ore is "able to take care of itself," and the large body of low-grade ore is looked upon as affording most probable likelihood of permanent profit in the working. No ore is now too low-grade to be successfully treated if it exist in sufficient quantity to justify the erection of works on a scale that would enable it to be treated in continuously large quantities. In this regard it is a noticeable fact that among the best mine dividend-payers are low-grade properties, some of whose ores yield a value of less than $2 per ton.

SOME time ago the New Zealand Government bought the cyanide patent rights of the Cassel Gold Extraction Co. for $50,000, and is charging users thereof in that colony 1½% royalty on their gold output. The Victoria Government now proposes to buy the same rights for that colony from the Australian Gold Recovery Co. for $100,000, recouping itself by a royalty charge of 2%. With two exceptions, the present royalty charged by the Gold Extraction Co. in the colony of Victoria is 5%. The Victoria Minister of Mines figures that in five years the impost of 2% will be abrogated and the use of the process be made free to all therein. In a paternal way those Governments try to encourage the mining industry. The South Australian Government allows a rebate of one-third the regular freight charges in the transportation of machinery for the use of new mines, and makes a similar reduction in freight charges on the first fifty tons of ore sent away from a new mine.

INTERNATIONAL POLITICS naturally affect so world-wide an industry as mining. Present war news from South Africa indicate increasing probability of wholesale destruction of mining machinery and appliances and the greatest possible amount of damage to the Witwatersrand mines as a necessary or inevitable war measure on the part of the Boers. Thus far, in limited way, work has gone on and little lasting damage has been inflicted, but the war now assumes a phase where the final stand at Pretoria is apparent, which, of course, involves the preliminary destruction of Johannesburg. It is also likely that the long threatened general European war may ensue, preparations therefor being manifest. These matters affect the American miner, resulting partly to his advantage, partly to his disadvantage. At present the disadvantages are in the front row. One of the most apparent is the cessation of foreign or Eastern investment in Western mining enterprises, a calling in of securities or insecurities, and a discontinuance of projected ventures. Such will not be an unmixed evil if it result in more vigorous domestic development. And the refluent tide of returning desire for a share of our mineral wealth will be all the greater.

Federal Aid for Mining Schools.

Senator Chauncey M. Depew, of New York, on the 9th ult. introduced in the U. S. Senate the following Senate bill No. 3109, to promote and encourage the mining, mineral and metallurgical sciences of the United States, which was read twice and referred to the Committee on Mines and Mining:

WHEREAS, the mining, mineral and metallurgical sciences and industries of the United States of America have not heretofore received the attention, encouragement and support from the National Government that their interests deserve and demand; and,

Whereas, the product of the mining and mineral industry of the country last year approached the enormous sum of nearly one billion dollars, contributing thereby greatly to the wealth and general support of the Government, rivaling that of its sister industry—agriculture; and,

Whereas, the general interests of agriculture are fostered, stimulated and encouraged by government aid, through the provisions of the Hatch and Morrill acts, to the extent of $40,000 annually to each State and Territory;

THEREFORE, it appears but proper and just that the general Government of the United States should endow and support in a similar manner the industries of the mining, mineral and metallurgical sciences of the country.

Therefore, be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that in order to aid in acquiring and diffusing among the people of the United States useful and practical information on subjects connected with mining and metallurgy, and in order to promote scientific investigation, research and experiment respecting the methods of mining, mine ventilation, methods of ore treatment and the recovery of metallurgical products, and in order to promote the study of the petrology, geology and mineralogy of the several States and Territories of the Union, there shall be, and hereby is, annually appropriated out of any money in the treasury not otherwise appropriated and arising from the sales of public lands, said money to be paid as hereinafter provided, to each State and Territory, for the endowment and maintenance of the department of mining in the State or Territorial Schools or Colleges of Mines now established, or which may hereafter be established, the sum of fifteen thousand dollars for the year ending June thirtieth, Nineteen Hundred, and an annual increase of the amount of such appropriation thereafter for ten years by an additional sum of one thousand dollars over the preceding year, and the annual amount to be paid after the expiration of the said ten years to each State and Territory shall be twenty-five thousand dollars.

SEC. 2. That it shall be the object and duty of said Schools or Colleges of Mines receiving the benefit of said fund to conduct original research or verify experiments on the mineral bearing rocks or deposits of the various economical metals of the several States and Territories; to investigate the building stones, mineral fuels, clays and all mineral deposits of whatsoever nature that may exist in any of the States and Territories; to experiment on processes of mining, ventilation, milling and the effectiveness and economy of mining machinery, and the various processes of ore treatment and metallurgy; to give instruction in assaying, methods of analysis, metallurgy, mineralogy, petrology, geology and kindred sciences, which have a bearing on work necessary to an intelligent mining and metallurgical education.

It shall be the duty of the governing boards of the Schools of Mines, with the advice of the President or Director of said Schools of Mines to indicate and outline, from time to time, special lines of work to be carried on, as the nature of the mineral products of such State or Territory may suggest as being a fruitful field or line for profitable research.

SEC. 3. That in case any State or Territory should not have a regularly established School or College of Mines, it shall be the duty of the legislature of such State or Territory to select some technical School or University, wherein the provisions of this act may be carried out: Provided, That such State or Territory so choose through its legislature to avail itself of the provisions of this act.

SEC. 4. That the sums hereby appropriated to the States and Territories for the endowment and support of the department of mining in the State or Territorial Schools or Colleges of Mines, shall be annually paid on or before the thirty-first day of July of each year, the first payment being due on or before July 31st, 1900, by the Secretary of the Treasury, upon the warrant of the Secretary of the Interior, out of the Treasury of the United States, to the State or Territorial Treasurer, or to such other officer as shall be designated by the laws of such State or Territory to receive the same, who shall, upon the order of the Trustees of the State or Territorial School or College of Mines, immediately pay over said sum to the Treasurers of the respective Schools or Colleges of Mines or such other institutions entitled to receive the same, and such Treasurers shall be required to report to the Secretary of the Interior, on or before the first day of September of each year, a detailed statement of the amount so received and of its disbursement. The grants of moneys authorized by this act are made subject to Legislative assent of the several States and Territories to the purpose of said grants: Provided, That payment of such installments of the appropriation herein made as shall become due to any State or Territory before the adjournment of the regular session of its legislature meeting next after the passage of this act shall be made upon the assent of the Governor thereof, duly certified by the Secretary of the Treasury.

SEC. 5. That if any portion of the moneys received by the designated officer of the State or Territory for the endowment of the department of mines in any State or Territorial School or College of Mines, as provided in this act, shall, by any action or contingency, be diminished or lost, or misapplied, it shall be replaced by the State or Territory to which it belongs, and until so replaced no subsequent appropriation shall be apportioned or paid to such State or Territory; and no portion of said moneys shall be applied directly or indirectly, under any pretense whatever, to the purchase, erection, preservation or repair of any building or buildings: Provided, however, That a sum not exceeding twenty per centum of any annual appropriation received by any institution shall be available, if deemed necessary, to be applied in purchasing scientific instruments and apparatus and to be used in the construction, erection, equipment or building of special apparatus and machines or plants, designed to successfully carry out the methods in scientific research as embodied in this act.

SEC. 6. That a full annual detailed report of all operations conducted during the past year ending the thirtieth day of June of each year shall be made out by the President or Director of each School or College of Mines, by November the first of each year, and transmitted to the Governor of the State or Territory in which said school belongs, and a printed copy of said report shall be sent to each School or College of Mines of the several States and Territories and to the Secretary of the Interior. Said report shall embody a lucid statement of all experiments and work of a practical and scientific nature conducted during the past year, embracing everything which may be considered of special value to the mining and metallurgical industries, including a statement of all receipts and disbursements necessarily arising in carrying out the provisions and intent of this act; Also, the condition and progress of each school, including general information as to the number of its professors, number of its students, its library and general equipment.

SEC. 7. That bulletins or supplementary reports shall be published by said Schools at any time when deemed of general importance to the mining community or to the interests of any particular mining industry or mining district. Such bulletins or reports and the annual reports of the several Schools of Mines shall be transmitted in the mails of the United States free of charge for postage, under such regulations as the Postmaster General may from time to time prescribe.

SEC. 8. That whenever it shall appear to the Secretary of the Treasury from the annual statement of receipts and expenditures of any of said Schools of Mines that a portion of the preceding annual appropriation remains unexpended, such amount shall be deducted from the next succeeding annual appropriation to such school, in order that the amount of money appropriated to any school shall not exceed the amount actually and necessarily required for the support of the mining department of said institution.

SEC. 9. That on or before the first day of July in each year after the passage of this act, the Secretary of the Interior shall ascertain and certify to the Secretary of the Treasury as to each State and Territory whether it is entitled to receive its share of the annual appropriation for the department of mining in its School or College of Mines, under this act, and the amount which thereupon each is entitled, respectively, to receive. If the Secretary of the Interior shall withhold a certificate from any State or Territory of its appropriation the reasons therefor shall be reported to the President, and the amount involved shall be kept separate in the Treasury until the close of the next Congress, in order that the State or Territory may, if it should so desire, appeal to Congress from the determination of the Secretary of the Interior. If the next Congress shall not direct such sum to be paid it shall be covered into the Treasury. The Secretary of the Interior is hereby charged with the proper administration of this law.

SEC. 10. That the Secretary of the Interior shall annually report to Congress the disbursements which have been made in all the States and Territories, and also whether the appropriation of any State or Territory has been withheld, and if so, the reasons therefor.

SEC. 11. That nothing in this act shall be construed to impair or modify the legal relation existing between any of the said Schools or Colleges of Mines of the several States and Territories, and the government of the States or Territories in which they are respectively located.

SEC. 12. That nothing in this act shall be held or construed as binding the United States to continue any payments from the Treasury to any or all the States or Territories or institutions mentioned in this act, but Congress may at any time amend, suspend or repeal any or all the provisions of this act.

Concentrates.

IRIDESCENT GLASS is made by exposing the melted glass to the vapors of salts of sodium.

PETROLEUM weighs six and one-half pounds per U. S. gallon - forty-two gallons to the barrel.

IN a dispute as to relocation of a mining property the burden of proof is on the claim jumper.

BY free air is meant air at atmospheric pressure, about fifteen pounds per square inch at sea level.

THE honest sale of any mining stock should be deferred till perfect title to the property is assured.

BEFORE coating mine timbers with any preservative the wood should be barked and well dried.

SPHENE is a silicate of lime and titanium, for which there is no industrial demand so far as known.

PURE carbonic oxide has no smell: its presence is known by a white vapory mist, called by miners "white damp."

IT is customary or usual with county assessors to assess an undeveloped mining claim at $100 valuation for taxation purposes.

WHERE acidulated mine water ruins the water end of a steam pump, gun metal or some similar composition may be used with advantage.

THIRTY-FOOT steel rails at eighty pounds to the yard weigh 800 pounds. Twelve miles single-track railroad would take 1800 tons of such rails.

A GOOD example of double-riveted 30-inch wrought iron pipe is afforded in the 22-mile line from Alvarado to Oakland, Cal., built about five years ago.

THE Malay State Miners' Association has asked the Government to reduce the royalty on lode tin from 14%, the present rate, to 8% on the gross output.

THE official survey of a mining claim must be in accordance with the recorded notice of location as of record at the time of the order authorizing the survey.

TO ANY ONE having opportunity to dispose of unprofitable mining stock it may be said: "Sell what you have, if you wouldn't buy it if you didn't own it."

SYNTHETIC chemistry is creative: its principal field is the production of substances in rivalry (or co-operation) with nature. Analytical chemistry takes things apart.

IN an arc lamp, supplied with a direct current, the consumption of the positive carbon is in round numbers 1 inch per hour, and of the negative carbon one-half that amount.

"A TON OF GOLD," Troy weight, is worth $496,123.20; avoirdupois, $602,921.93. Should the inquirer contemplate such purchase he should insist on the seller supplying it on the latter basis.

THE Con. Cal. & Va. gold and silver mine in Nevada has declared dividends aggregating $78,029,000; the Calumet & Hecla copper mine, Michigan, has a record of $67,850,000 dividend disbursements.

WHERE the air cylinder of a compressor is 12 inches in diameter, stroke 18 inches, when running at 120 revolutions per minute, it will furnish 56.5 cubic feet of compressed air at sixty pounds on gauge.

THE Osceola copper mine, Opeechee, Mich., is worked in an amygdaloid vein, an altered trap rock, the copper varying in size from fine grains to large masses. The amygdaloid is from 3 to 40 feet in width.

THERE are 371.25 grains pure silver in an American silver dollar. To every $2000 silver coined in the U. S. Mint is added one pound of copper. There are 23.32 grains pure gold in an American gold dollar.

THERE are several salt works in successful operation on the Pacific coast, one at Alameda, Cal., another in San Diego Co., Cal. The Inland Salt Co., Salt Lake City, Utah, operates a rock salt drying plant.

SATURATED STEAM, pressure above zero, 100 pounds to the square inch, a temperature of 327.57° Fahr., latent heat 882.91 B. T. U., total heat above zero 1213.84° Fahr., B. T. U., weight per cubic foot would be 0.233 pound.

THERE are several good mining schools, notably in California, Colorado, Michigan, Pennsylvania and New York. Those in California and New York are connected with and form a distinct part of a university course.

THERE are numerous devices for ventilating mine shafts, some of them simple and cheap, others more complicated and expensive. Write to the M. C. Bullock Co., Chicago, for their catalogue No. 35 on mine ventilation.

THE deepest hole, so far as "Concentrates" knows, bored in the earth's surface is at Paruschowitz, upper Siberia, which at last accounts had reached a depth of 6783 feet, the temperature increasing to 10° C. for every 111 feet.

IT is seldom that there is room for two superintendents in one mine, and the better plan in the case specified is to have a frank and friendly adjustment of all internal difficulty before increased expenses or personal collision creates serious trouble.

THE horse power of a water supply may be approximately determined: multiply number of gallons per minute by pressure in pounds per square inch, and divide product by 1500. "Pressure in pounds per square inch" is found by multiplying number of feet fall by .433.

BY reason of improved methods, better transportation and general advance in the mining and scientific world, $100 will do as much in mining work to-day as $400 would thirty years ago. But the gold product brings as much to-day as it did then. Gold mining is the one business on earth of which this can truthfully be said.

AN important feature in boiler practise is carrying the water at such a height in the boiler as to prevent explosions by the exposure of the tubes to the fire, and, at the same time, leaving as large a space as possible, insuring dry steam to the engine, thus deriving from the boiler the most effective duty possible.

TO FIND the horse power necessary to elevate water to a given height, multiply the weight of the water elevated per minute by the height in feet and divide the product by 33,000 (an allowance should be made for water friction and a further allowance for losses in the steam cylinder, say from 20% to 30%.)

BEFORE blaming the assayer be sure of your samples. It is also well to be sure that you are paying for good assay work. A good assayer can not afford to do cheap work, and, in this as in other lines, skill, accuracy and knowledge must have adequate recompense. A man mustn't expect a $2 assay for 50 cents.

THE Eisenzecher-Zug mine, near Siegen, Germany, has yielded continuously since 1495. The Rio Tinto mine, Spain, is credited with production for nearly 2000 years. There are gold mines in California that have given continuous product for fifty years. How many other businesses can show so permanent a record?

IN all quick-acting electro-magnets, and in magnets for alternating currents, the core should be laminated, to prevent eddy currents. Sometimes, however, when the alternations or pulsations are not very rapid, the eddy currents are prevented, by making the core tubular and slitting it through lengthwise on one side.

THE following are the barometric pressures at different altitudes: Pressure at one-quarter mile above sea level, 14.02 pounds per square inch; one-half mile, 13.33 pounds; three-fourths mile, 12.66 pounds; one mile, 12.02 pounds; one and one-quarter miles, 11.42 pounds; one and one-half miles, 10.88 pounds; two miles, 9.88 pounds.

TO FIND the diameter of pump plungers to pump a given quantity of water at 100 feet piston speed per minute, divide the number of gallons by 4, then extract the square root and the result will be the diameter in inches of the plungers. This is for single double-acting pumps; for duplex double-acting pumps, divide by 8 before extracting the square root.

SAN FRANCISCO men bought the "Lost Confidence" mine in Shasta Co., Cal., in July, '86, for $125,000—$50,000 cash, the rest payable from the mine's net earnings. They built a 20-stamp mill, spent $100,000 and quit. In '94 the Mountain Mines Co., Ltd., of London bought the property for $300,000, has spent about $1,000,000 and is producing matte copper at an estimated annual profit of $500,000.

THE American Smelting & Refining Co. is a consolidation of fourteen smelting and refining concerns. Its first fiscal year ends on the 1st prox. The capital of the company is $65,000,000, one half 7% cumulative preferred and one-half common; it has paid 7% on the preferred stock during the year. The company has a working capital of about $7,000,000 and proposes to bring this amount to $10,000,000.

INFALLIBILITY is an attribute humbly disavowed by any paragraph published herein; the sole idea being honest effort to give information regarding questions asked, and any manifest error in such is always gladly corrected upon being pointed out. "Concentrates" is fully aware of the constant possibility of mistakes in statements made herein and constantly invites criticism or correction.

THE holder or locator of a mining claim can not legally continue in possession of it just by making an application for a patent and then neglect or refuse to perfect title by making final entry and paying the Government price. He must use due diligence in going on with the rest of the Government requirements after he has made application for patent, a reasonable amount of time being, of course, accorded him.

ROCK FILLING, tightly packed in, is more durable and stronger than timbers. Where it abuts on an open space intended to be maintained as a permanent opening, the filling should be faced with a rough walling built up of the larger pieces, the smaller being thrown back of this. Such waste for filling obtained from dead work in the mine can be used on the level where made or on the one immediately below it.

THIS paper has no sympathy with the man or men who try to hold a number of unpatented mining claims year after year without doing the requisite amount of annual assessment work thereon, but who ask an impossible or prohibitory price from any one proposing to take hold, in a tangible way, of any one of them. Trying to hold everything in sight in that way hurts the man himself and that entire section.

APPROXIMATE determinations of the reduced efficiency of air compressors are made by deducting the percentage of difference between the barometric pressures at the respective altitudes. The volume at sea level being 1, that at one-quarter mile above sea level will be 7% less; one-half mile, 11% less; three-fourths mile, 16% less; one mile, 20% less; one and one-quarter miles, 24% less; one and one-half miles, 28% less; two miles, 34% less.

COPPER OXIDE or cupric oxide is a by-product in considerable quantity where copper-iron pyrites are burned for the manufacture of sulphuric acid. It is readily manufactured direct by exposing scraps of thin sheet copper in a reverberatory furnace for eight hours; if the resultant be ground and reburned comparatively pure cupric oxide will be produced. It is of great industrial value in refining petroleum that may contain hydrogen sulphide gas.

WHILE it is essential that there must be manifest merit in any proposed "mining invention," it is to be admitted that the securing of favorable publicity in the proper quarter has much to do with bringing the device into immediate demand. But no amount of "booming" will keep any kind of mining apparatus in permanent favor unless it has inherent merit that will commend itself to the favorable consideration of the practical miner.

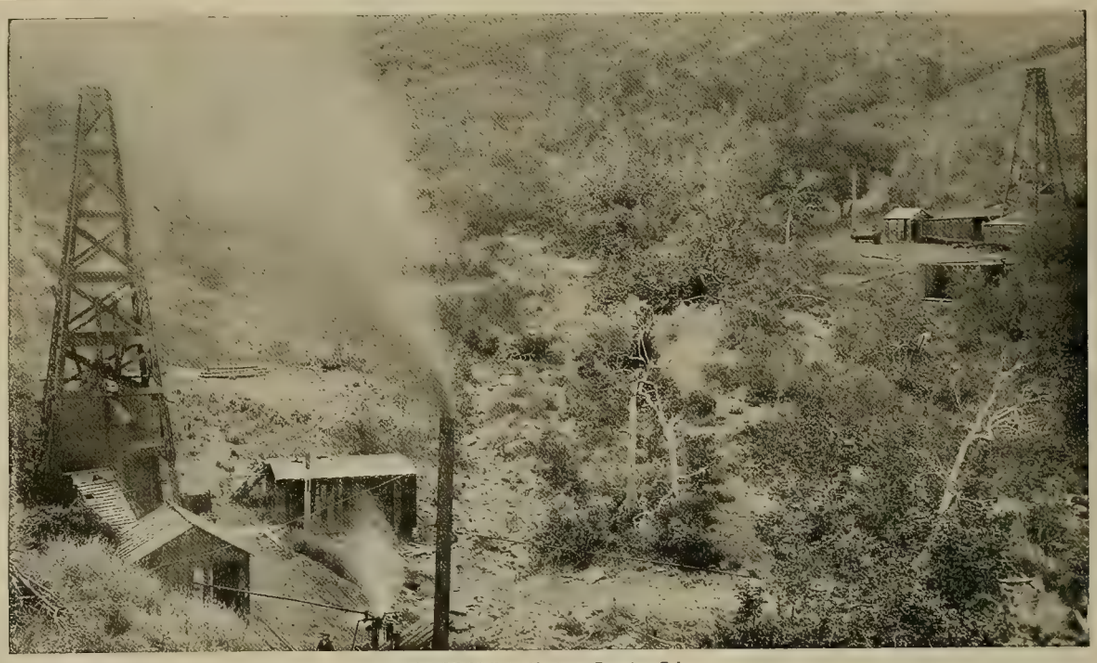
IN bonding a mining property great care is necessary that the contract or agreement be in writing, and be clear and explicit, not only that its provisions can be understood, but that the meaning of every word can not be misunderstood. Good faith is to be presumed on both sides, but a cunningly worded bond can tie up a mine and its owner. A form of bond fair to both sides should be used and the whole thing gone over fully before signing. Once signed, it is little use to play baby or claim ignorance of the contents of a contract.

IT is for any prospective user of power to determine whether water, steam, electricity or compressed air can best and more economically serve his purpose, and this can only be determined by accurate knowledge of the circumstances in connection with each individual case. Local surroundings, conditions and requirements differ so greatly that each one must be considered by itself, and none but the most general of rules can apply. In the case specified our advice would be to consult a competent mining engineer and take his advice.

THE California mineral land bill is before Congress this winter, and deserves favorable consideration, for it is a worthy and necessary measure and should be promptly passed upon its merits, but the fact that Stewart of Nevada is still Senator therefrom and still doing business at the old stand militates against its progress. Public opinion has retired other Senators and Congressmen who opposed it, but corporate influence successfully retains one or two useful servants in both houses, of whom the U. S. Senator from Nevada is the most conspicuous.

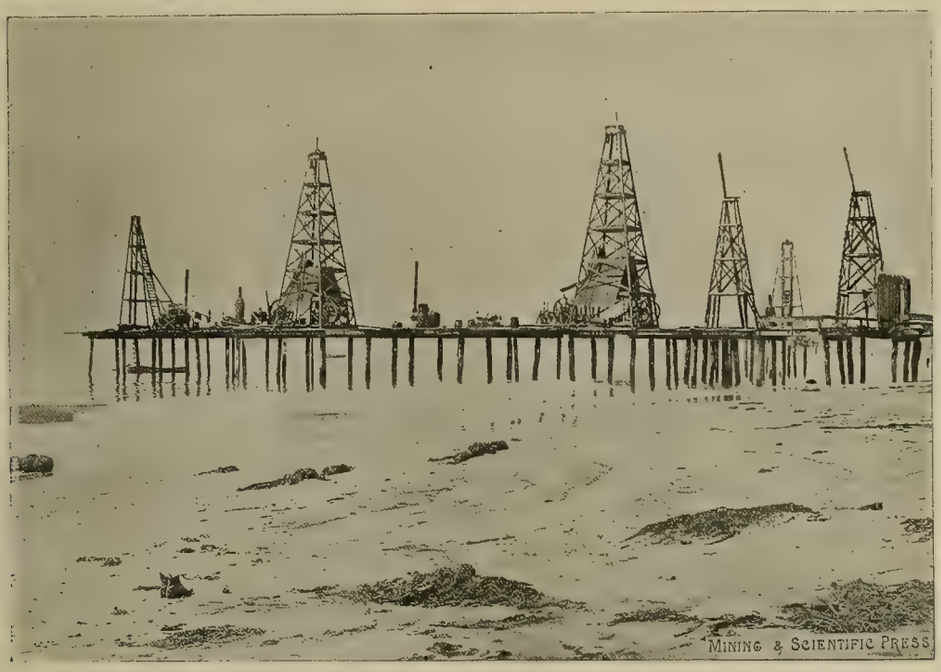
A MINER'S COMPASS consists of a magnetic needle, with counterpoise, suspended on a horizontal axis, so that it is free to revolve in a vertical plane. The needle is ordinarily enclosed in a circular case with glass sides. Degrees are marked on an inner circle, beginning with 0° at each side, and graded down to 90° at the bottom. The needle being properly counterpoised, if the north end be drawn downward the attraction is positive so many degrees: if the south end is drawn downward, the attraction is negative, say 20°. It is used in prospecting for magnetic iron ore.

THE editorial statement was made in last week's issue that ore going less than $2 per ton was mined at a profit. Being asked "Where?" Concentrates calls to mind several instances: at the Atlantic mine, Houghton, Mich., where the $2 ore is mined, carried, put through a stamp mill, concentrated, smelted, at a total cost of $1.10 per ton; at the Deadwood-Terra mine, South Dakota, where a 160-stamp mill has crushed 15,000 tons per month of ore averaging $1.80 per ton, at a total cost for mining and milling of $1.40 per ton. Other instances are quotable in California and elsewhere.



IT were, indeed, better, as claimed, if mining stock could be non-assessable. Outside of California it is—nominally. But however ideally correct such plan may be, it is the common practical experience that it is only by the assessment plan that non-paying properties owned by a corporate company can be successfully or continuously operated. If money is needed to go on and it can not be got out of the mine itself the only way is to levy an assessment. It can be called "voluntary contribution" or "pro rata contribution" or anything else—but it is an assessment just the same. When some of the owners of a property tire of paying out money for development work and decline to further contribute, in the absence of State statutes regarding assessment work, nothing can be done, so far as they are concerned.

TO KEEP ice out of a hoisting shaft, if a three-compartment, board up, with corrugated or galvanized iron, both hoisting and pump compartments to the top of the pulley wheel frame, place doors at the lower landing or top of shaft in all three compartments, open the one intended for downcast and shut the one designed for upcast, place the steam jet or pump exhaust in the upcast side. The heat of the steam will warm the upcast side and create a vacuum or motive column and the necessary ventilation and melt the ice. If the downcast side becomes frozen again, which will be sure to follow in cold weather, all that is necessary is to reverse the air column in the shaft by opening the door you want for the downcast and shut the door for the upcast, as above. It is not required to cover the top of either of the compartments. The pump and suction pipe must be in the return air-way, and the water column pipe as well as the exhaust and steam pipes must have drain cocks or small gaspipe with valve attached in order to drain the pipes thoroughly when the pump or jet stops working. Connections must be made in such a way at the pump exhaust and steam jet that they can be used in either of the shaft compartments.



The California Oil Industry.

Written for the MINING AND SCIENTIFIC PRESS by ERNEST HORSFALL RYDALL.

The air in California, as well as the ground, is full of oil. It is on the street, in the bank, in the office—everywhere; officials at the Los Angeles city hall and courthouse are establishing local companies restricted only to employes in their respective establishments; clairvoyants are in league with oil companies to influence believing women that stocks in that or the other company are bound to rise; the consequence: oil companies, in luxurious offices, are in every block in Los Angeles, often the same men under different names operating the various investments. Valuable space in the local papers is daily filled with lurid descriptions of the fortunes that await investors in shares of oil stock, and, indeed, remote must be the district and illiterate the domestic to whom the dazzling pictures of fortunes in oil investment are not as familiar as a twice-told tale. An oil exchange has been formed in Los Angeles, occupying a store room on the principal street, where for an hour a day the interested meet and advance or depress oil shares. Hundreds of derricks are being established beyond the original oil limits, and

An Oil Well in Ventura County, Cal.

Submarine Oil Wells at Summerland, Santa Barbara County, Cal.

Pumping Petroleum From Under the Sea, on the Sea Beach, Santa Barbara, Cal.

day and night the pumps are unceasingly pumping oil. For rugged, precipitous hills, that a few months ago were worth only a few hundred dollars certified checks for a hundred thousand are now refused; property is easily leased at fabulous prices, and many a man who a few months ago had joined the vast army of the financially embarrassed, that will ever afflict this favored section, is now beyond the dreams of avarice and knows his old-time companions no more.

This condition is not confined to Los Angeles; from San Diego come reports of increasing oil findings; near Del Mar is believed to exist extensive oil deposits. Right on the bluffs, fronting that staid Pacific that three centuries ago to the amazement of a lot of savages carried the Spanish galleons of Cabrillo, now stands the serried oil derricks. The Puente district has for eleven years been producing oil; the output is increasing in the Coalinga valley; the district is enlarging to Fullerton, and even up to the barren desert of the Mojave, in the Sierra Madre mountains, come reports of new oil fields, resembling the Pennsylvania excitement of years ago. Los Angeles, Ventura, Kern, Orange and Monterey counties are all producing oil, and it will not require a very lively or enthusiastic imagination to picture in this remote corner of the continent, between the desert of Arizona and rugged mountains and the placid, silent Pacific, another vast oil field yielding millions of tons of oil for consumption as fuel and furnishing employment to a community who have been attracted here by laudatory advertising or their own health needs to linger through a precarious and uncertain existence in the land of the olive and the vine.

Six years ago an enterprising individual bored an oil well in Los Angeles; since that time 700 wells, each costing $2000, have been sunk. While some of these have become exhausted, a great many are still running, and new wells are being dug at the rapid rate of at least 100 a month. A procession of tanks is ever on the move from the oil districts to the various city manufactories; electric light machinery works and railway shops carry this valuable fuel, 3½ barrels of which is equal to one ton of soft coal. The base is of the California asphaltum, instead of paraffine, as are the Pennsylvania oils, making it, therefore, not suited for illumination; its average gravity is about 15°; it is a thick, black oil, and one of the best fuels yet discovered. Its by-products enter into the lubricating oil, the painters, printers and other trades, and the asphaltum, after the oil has been extracted, can be used for street paving; indeed, the ancient Mexican who inhabited these regions a hundred years ago used it for roofing. The most classic and beautiful residence district of Los Angeles has been invaded by this industry; where dwelt the city Crœsus now exist lofty derricks, disfiguring the landscape, and now can be heard the creak of the pumping machinery, the swish of the steam and noises of all descriptions that disturb the silent watches of the night. A thousand dollars a day for a 50 or 100-foot lot, however, somewhat compensates the capitalist, who is compelled to wander to another aristocratic district to find suitable surroundings for his luxurious and refined family. This invasion of the residence district by the oil speculators, divided as it is into little lots, has resulted in wells being sunk within 50 feet of each other, and thus each anxious owner, pumping for a while the supply in the vicinity of so many wells in so small a space, has exhausted the output in the vicinity and returned the lots to their original comparatively insignificant value. Such an absurd juxtaposition of oil

lots was never before neard of; yet, a farther depth may result in more oil being produced, and wells may be revived after a period of exhaustion.

There is no surety as to the cost of sinking an oil well: a safe average may be stated at $2000. Going through soft sandstone, the borer has a comparatively easy task, unless he drop a tool or break his tubing, when the cost may be much increased. At first the product sold for $2 per barrel of forty-two gallons, but went down to 35 cents, at which period the railroad companies altered their engines to burn oil, for oil at that figure resulted in vast economy to them. After the engines were changed to burn oil up went the price, so that coal after all proved in some cases the cheaper fuel. The price is not likely to go over $1.25, and may, in consequence of the recent discoveries of new fields of almost unlimited extent, go down to a nominal figure again. Large storage tanks are built in Los Angeles, containing upwards of 500,000 barrels of oil. The average daily production in Los Angeles is about 5000 barrels; nearly $2,000,000 per annum, therefore, is flowing into Los Angeles county to-day from the sale of oil alone, and about an eighth of that is paid to the workers at the pumps and the haulers of the portable tanks. A vast force is engaged in the manufacture of machinery for the oil wells, and, in quoting these statistics in reference to the widespread benefit of the oil industry, some odd thousand street oil brokers and dealers in oil company shares must not be forgotten, for these people subsist, temporarily at least, upon the indirect oil output. One of the most interesting oil fields is that of Summerland, in Santa Barbara county, where wells have been dug out in the ocean below high tide, and wharves are run out from the shore upon which the pumping machinery is placed.

When we consider the fact that the export oil trade of the United States is decreasing; that the total shipments of 1898 were 30,000,000 barrels less than those of 1897, the discoveries of new oil fields and the attending excitement in California will be gratifying. It opens a prospect for the Asiatic trade that this country will undoubtedly take advantage of; the Russian and Bornean oil will have a competitor in California; freights to the Orient from San Francisco will be considerably less than from Philadelphia; indeed, there is sufficient in sight to induce an everyday, ordinary capitalist to look into the matter, and to do so as quickly as possible before the Standard Oil Company, with its eagle eyes and Argus hands, shall reach out and embrace the famed oil fields of southern California.

A Defense of the Divining Rod.

No one outside the incurable ward of an insane asylum should give a moment's serious consideration to a "divining rod" or "dousing stick" or other similar device in the hands of any one purporting ability to indicate the presence of mineral in the ground.—MINING AND SCIENTIFIC PRESS.

TO THE EDITOR:—Referring to the above, it can be said that a defense of the divining rod as a means of finding ore veins may draw upon my devoted head a shower of abuse or denial. Nevertheless I sail in and plant the standard.

Prospectors travel carefully over a country, examining river bottoms and mountain ranges, knocking off pieces of rock, applying the glass to see whether they contain mineral, and in time, if the country is clear, they will find nearly every ore vein apparent on the surface. But where the largest and richest veins are covered there is no possibility of finding anything to guide him, and the prospector has to abandon that field as "no good." His compass is no use unless he has the bearing of a ledge coming from some outside place; he is in the dark and can do nothing because the very bearing he brings with him may assume a new curvature.

The man with the divining rod steps in and can point out where the veins are to be found; not by chance or guesswork, but by an inherent law of science or nature which can be demonstrated as easily as the law of telegraphy. The rod is not a mere toy to be laughed and sneered at, or even trifled with, for in the hands of a man who intelligently understands its use or power it is a sure and certain indicator of veins or ledges.

A deep shaft may have a complex or erratic vein and the ore body may be lost, and this may have taken place so gradually that it is pronounced a "pinch out," or the ore body may have disappeared and the gangue has been filled with base wandering stuff. It may be a fault, throwing the ore up or down, or it may have thrown the ore body into a parallel vein 40 or 50 feet on either side. The management would probably follow the trend of the vein, expecting to overtake the elusive ore; then he would crosscut on either side; in crosscutting he might start on the wrong side and get tired finding nothing; then makes a faint attempt on the other side and quits work ere the ledge with the ore in it is found, and the mine is abandoned.

The undeviating law which the man with the rod is impelled to work by is as potent in the deepest mine as it is on the surface, and he can direct where to find the lost vein.

In placer and blanket deposits the divining rod can not be employed, as the rod has no affinity with loose or wandering deposits. In coal fields the rod is less efficacious than in metalliferous mines. The dykes which ramify a coal field are a source of expense and inconvenience, especially if conducted on the long wall principle. The divining rod can follow the line of every dyke in the field and show where they intersect each other, thus giving the operator timely notice and saving his output from sudden shrinkage.

I would observe in passing that Mr. Fox, of Cornwall fame, experimented with the electrical currents in the veins of mines long before wireless telegraphy was thought of, and telegraphing through a mountain is not new. And yet the same law is subordinated to the man using the divining rod. The great currents which run from circumference to center of the earth's crust are careering through the veins, fissures and dykes. It cannot yet be ascertained whether the currents are going into the earth or the reverse, but it is a moving, vital energy and represents a volume of force feeling much like the shock of a battery returning after an unsuccessful attempt to put off a blast. The question remains unanswered to-day, What is electricity? The mysterious question might be asked, What is the divining rod? I frankly confess I do not know, but I will tell you how it acts and feels in the hands of a magician who is learned in its many uses.

If one comes across a vein of some magnitude, strong with powerful and distant surface attraction, and will reach down and down far into the crust of the earth, this vein will so transfix the rod man by the full force of the strong current that he may have to drop the rod so as not to receive the full force of the current into his body. A vein of this quality can be felt 30 feet on each side of the center. As three veins generally run pretty close together, the strongest can be selected for operation—that is, the one carrying the greatest volume of electricity. Some one will turn his attention to the discovery of an instrument to measure the strength of the currents much in the same way that is now done in electrical science, and the prospector will have a "current indicator" instead of the old divining rod.

There are veins and veins—some so feeble that the experienced rod man is at a loss to know how nature has spent so much time for so little, because the uninitiated may rest assured that a vein with a weak current is one of nature's misfits. There are many mines that have a good showing, and that was all the ledge ever had. The application of the rod by mining engineers would save many a mining venture from turning out unprofitable were this science more relied on than trusting to guesswork. About the electrical currents, there stands the open door for every man to satisfy himself. He may follow a natural law and continue on. An experienced man can trace a vein on the surface with about as much sagacity as a pointer dog the game. The rod is used frequently to indicate the vein line, and you do not get away from its influence. When you have got to a place where an opening would be convenient to make, you come as near the center of the vein as you can by trying the weight of influence on each side and reaching the center by successful trial. This is proved by stepping on each side until the attraction entirely ceases, then counting your steps into the center, and repeating this operation on the other side in the same way. You will find that the three points will make a central one, and you may sink your shaft or open your prospect hole with the utmost confidence of finding a vein, though it may be covered by 20 feet of surface. In following a vein great care must be taken lest one gets on a new trail, as outside veins, and sometimes shoots from the vein you are following, will create a divergence, and it is a good plan to keep your compass to note the bending of the vein you are running, and when any vein leaves or joins. It is a well-known fact that very many great veins of ore do not come through the surface, and many continuous veins are lost from very trifling causes.

I was in the Atlin country last year and found the rules which I have laid down here perfectly reliable in the snow so long as the feet touched the ground. All men who know anything about mining know that a creek is a good place to look for an ore vein, usually in the line of the running water, and yet I have been perched on a log crossing a waterfall and applied the rod and found that a vein was under me, and had no difficulty in finding it, the ends of the log which I was standing on acting as a conductor to my body. Wherever great veins have been lost in the mountain ranges they can be followed up in the snow as easily as on the bare ground. It has been known that a whole mining camp took water from a valuable ledge for two years, and had no idea of its existence until it was pointed out that there was a strong vein at that point.

I have traveled through the gold fields of Ballarat in Australia and in New Zealand, west coast of Mexico, Central America and California, and have never found the rod to fail. In going along what is called the mother lode of California there is no single vein from Jamestown, Jackson, Sutter Creek or Angels to Amador that will not bear that construction. It is a mineral belt or zone and may be described as a series of veins running in somewhat parallel lines, but moved slightly by cross veins, leaving the main ledges and pursuing courses at intervals from either side. Many of these cross veins have not been worked. They are sometimes very rich. There are other veins between the main parallel ledges which never leave the belt and form a doubling. They are massive, and it takes nice discrimination to say whether they are one or two. The divining rod which points out the veins of the earth does not say whether they will be rich or the reverse.

In going along the mineral belt between Quartz Mountain and Amador, California, where so much underground work has been done, and where the veins can be traced with accuracy, the moment your foot touches a vein that has been tampered with or mined underneath the divining rod ceases to act and is utterly useless. Therefore you can tell the extent of mining operations from the beginning to the utmost extension of the workings You observe that the connection between the divining rod and the vein is cut, and to obtain a connection of the same vein you must go down the shaft and set your foot on the solid ledge.

There is quite an array of talent, learned and otherwise, in the complex science of petrography attempting to give a scientific description of some country rocks and genesis of veins, and when it is a mixed proposition it has to have a multo-coinage. I admit that geology is a tentative science and that we are but groping our way. The miner has no finger-post set up to guide him; it is the miner that guides the geologist; their reports are loaded with ingenious guesses as to how values come into veins and pockets as ore bodies; that hot water was the agency by which this was effected, not thinking or overlooking that there is a law of nature going on in full blast to-day. The gases which are coming up from great depths is a more subtle agency than water, and, passing the electrical currents, eliminate their values and they fall in imperceptible vapor as it rises to the surface. All practical miners know that every ledge has a core. The core may be in the center or on either wall, where the highest values are to be found, and by applying the divining rod it will indicate that very place as the center of the vein, or where it is situated. What I am advancing here can easily be verified, and it opens up a new field for the progressive miner. He sees now that the values are deposited by a twin agency, the deep gases and the electrical currents.

It will be obvious to everyone that the intelligent man with the rod works in line with the greatest discoverers of the age. We might advance another step and ask, Where is the home of electricity? It seems to be always present and is subservient to man's use when the conditions are observed which are necessary to bring this giant into use. Is it in the elements of nature where we see the bright flashes and hear the thunder roll? We think it is not there. Then it must be in the earth, and we find this idea sopported by our own experience and by every electric wire which is set up having to be grounded to complete the circuit. Electricity is found in every vein, fissure, ledge, dyke and underground watercourse of the earth; there is no limit to depth or height. We have an idea of what it is, contenting ourselves with pointing out some of the places where it may be found and to what uses it may be put. Accident may bring to light what the most devout student has failed to grasp.

After working a day with the divining rod one feels limp, worn out and drowsy. Three or four hours' work in a day is long enough, for when such is carried on too long the amount of electricity which passes through the body engenders lassitude.

A remark that is always hurled at the man with the divining rod is: "When you know so many good things, why don't you keep them for yourself?" The reason is that no man can open out a mine by himself, and if we kept all the good things a man would be claim poor. The rod is the mining engineer's handmaid, which guides his practical knowledge along safe and practical lines.

DAVID KIRKWOOD, M. E.

Victoria, B. C., March 10.

The above interestingly illustrates the truth of the aphorism, "A little learning is a dangerous thing." The sincerity and honest purpose of the writer are manifest. Many believe what he asserts, and his statement is far better put together than the usual arguments received in favor of the divining rod. Superstition lingers along the borders of every form of advancing industrial activity. Whatever his form of faith, the devotee dislikes rude disturbance of his belief, and if a man find happiness in believing such things it were unkind to say him nay.

Fireproofing Wood.

The business of making wood fireproof is growing. The process of rendering wood non-inflammable is not a cheap one as yet, though it is thought that it will be considerably lessened within a few years. One process resembles embalming. The wood is first relieved of its saps and juices, which are really its blood, and a preservative fluid is injected to take their place. The planks to be fireproofed are put into a boiler or digester. This is closed, steam at a low pressure is run and the wood parboiled from ten

to fifty hours, to soften and loosen the dry saps or juices in the fiber. After the steaming process, a vacuum pump draws the saps and juices from the wood, leaving a finely divided cellular structure. The fireproof solution is then pumped into the chamber, absorption and saturation being assisted by the partial vacuum. A pressure from 80 to 200 pounds to the square inch is applied and maintained until the absorption is complete. After draining off the excess solution, the wood is withdrawn and thoroughly kiln or air dried, with the result that the interior cellular wood structure is left filled with minute crystals of fireproofing salts. In a series of tests conducted by fire underwriters small slivers of various varieties of wood were taken from the interior and exterior of treated samples. When held in an alcohol flame, the slivers would char and glow as long as the flame was applied, but in all cases upon the removal of the flame the glow would immediately die out. Combustion was not supported or maintained without the alcohol flame. Samples of 1-inch sheathing which had been boiled for two hours in water showed a depreciation in fireproof qualities, and, in some cases, would support combustion. A blast torch applied to the surface of a treated sample produced no effect beyond charring where the flame was applied. The charred surface protected the inner portions, and it was with difficulty that the sample was burned to any considerable depth.

A Technical Word for Common Use.

The twelfth census may bring into general use a hitherto technical word—"median"—to advantageously replace in many cases the word "average" and in many others the word "center" for the purpose for which they are usually employed. The idea sought to be conveyed by most people when they use the word average, and which is conveyed to them when used by others, is better and more accurately expressed by median. So, too, it is with the use of the word center in many instances, median expressing the precise idea, "center" or "average" only approximating the idea sought to be conveyed. There is a difference between the meanings of these words, as there is between the words "plurality" and "majority."

For example, the average of the population of the United States is 25 years, the median age 21 years. By median age is meant that point at which there are as many above as below. The 80-year-old person has no more influence in pulling up the median age of his community, as will appear from the formula from which such average is obtained, as follows: If there are 157 persons 1 year old, 113 2 years old, 95 3 years old, and so on, the 157 would be multiplied by 1, the 113 by 2, the 95 by 3, and so on as far as the ages go, and then the grand total would be divided by the whole number of persons. The quotient would be the "average" age, being the number of years of life enjoyed by the average person. For statistical purposes the median age is just as valuable for many purposes as the average age, and the establishment of the distinction between average age and median age is important, as numberless errors arise from confusion of the two, just as errors would arise from confounding plurality with majority in discussing election returns.

There is the same difference between the center of population and median point of population that there is between average age and median age. The center of population of the United States is not the point at which there are just as many people south of it as north, as many east as west. That point is not the center of population. At the eleventh census—1890—the center of population was twenty miles east of Columbus, Ind., while the median point of population was about seventy miles to the northeast, in Darke county, O., near the western border of that State. The reason the center of population gravitates west of the median point of population is that the Pacific coast population is on the long arm of the lever, and influences results as the octogenarian does the average age. Counting the Philippines, our center of population would take a big jump to the westward.

W. F. Wilcox, whose field is statistics and economy, and who has charge of the division of methods and results in the census bureau, says: "To assume that the influence of each person in determining the situation of the center of population increases with his distance from the center involves very questionable postulates. Statistical arguments very greatly exaggerate the resemblance between physical and social phenomena. In fixing the center of gravity of a physical mass a unit gains power by remoteness, but in forming the public opinion of a social group the unit loses power by the same fact. The median point of population, the point such that half of the population of the country is east and half west of its meridian, half north and half south of its parallel, offers the practical advantage of being easier to locate than the center, and also, I believe, the advantage of being nearer the average man's interpretation of the term."

COAL TAR by the barrel is worth about 7½ cents per gallon at present, a higher price than usual, being in increased demand as a source of picric acid, which enters largely into the manufacture of the explosive lyddite for the South African war.

Masonry Dams and Retaining Walls.

NUMBER V.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by GEORGE T. PARDOE.

Since writing the body of the present paper, which has been intended solely to instruct in a method of design, the writer has thought that it might be desirable to give a short appendix containing a few practical hints as to preliminaries. The author has noticed that mine superintendents and boards of directors are often wholly ignorant of the steps necessary to ensure the satisfactory execution of works but suddenly conceive the idea that a dam (for example) would be desirable and forthwith start to build it of second-class materials and of a "guessed" size and height. The result of such an ill-digested scheme is too often unsatisfactory and the actual builder is apt to be blamed instead of the real culprits.

If any reader of these notes should have the misfortune to be employed under "contract" under such an ignorant superintendent (and there are many such) and receive orders to build works foredoomed to failure, he is strongly advised to take the earliest opportunity of stating their insufficiency in writing and by this means he will cover himself from the results of any failure. Any man acting thus, should, however, be quite sure of his ground and be prepared to put his full case into written form, and it is also very desirable that he should have another properly designed work in his pocket, for an ignorant man occupying a superior position would be quite likely to ask his officer "How would you build it then?" and perhaps turn over the whole job, when it will of course be the business of the objector to make a good job of it and get the utmost possible credit for his work.

Now, before building a dam or starting work in connection with it, it is necessary that we have a clear idea of our objects. The two probable objects are: (a) To simply divert the water from one stream into another, perhaps at a higher level. And (b) To act as a storage reservoir to render the supply of water more uniform and perhaps also answer the purpose of (a).

The dam for (a) is usually quite low and is really as a rule better described as a "weir" and may be dismissed from our consideration, a stake and mud dam often answering all requirements and having the merit of cheapness.

Presuming that a storage reservoir is required a survey of the ground is nearly always necessary.

At the head of the ground forming the headwaters of a mining ditch are often alluvial washings not owned or controlled by the ditch owners. A level will then be necessary to determine the possible height of the dam to avoid flooding these washings, or, if found possible to purchase them, how far it will be necessary to do so with the required height of dam.

Now, although many works are no doubt constructed without much preliminary guiding data, and yet give entire satisfaction, yet this is to a great extent chance work, and it is much better to spend time in laying a good foundation for subsequent work. In many cases time cannot be spared for such preliminary work and it is therefore necessary to work more on gumption and instinct as to the advisability of the proposed work, and although it may result in satisfaction, yet subsequent surveys may show that if the dam had only been raised a foot or two higher a much larger storage room could have been obtained, or, on the other hand, that the dam as built is too high already and therefore costly.

There are many cases, however, where no such hurry need occur and it is such cases which prove the value of a steady, level-headed mine manager who is careful to look ahead and see what will probably be wanted in the future and what data are required for the satisfactory design of such works, and who is not too jealous (of any one gaining a little credit) to leave matters at the end of his term of management in such a state that his successor may carry out the works, if desirable, and who is by his predecessor's care provided with the necessary data.

It is therefore desirable, having gone over the ground and determined the approximate position on a stream of the site of our dam, to look lower down the stream for a suitable place to establish a measuring weir, which can be read by the man in charge of the ditch and reported daily or weekly as required. Rain gauges of a size dependent on the amount and intensity of the rainfall should be established, and read as often as practicable, which, in conjunction with the weir readings, will give a means of estimating the probable maximum floods and the ratio of the mean flow to the maximum and minimum flow on which the amount of storage required depends. Data such as these take time to procure and a manager would find it desirable to start the collection of them as soon as the idea of a reservoir is mooted, but some managers have no soul beyond making a big show during their term, by picking out the eyes of the mine and reducing all expenditure beyond that required for the immediate present.

Simultaneously with the collection of these data a contoured survey should be made so as to determine with more or less accuracy the cubical capacity of the reservoir above the outlet.

The method of making the survey will depend pretty largely on the degree of accuracy required and the character of the ground. Generally speaking, if the ground is fairly open, a fairly accurate and close triangulation to prominent and marked positions on the basins will be best, and these points can be connected together quickly and cheaply and with sufficient accuracy with a 4-inch prismatic compass, with which instrument the details can be filled in, and, the triangulation giving a considerable number of starting points, there is no chance of any serious error being carried throughout the work, and, the main points being fixed, the details can be filled in whenever a few days' leisure can be found in the intervals of other work, though it is always more economical to carry a job right through from start to finish without a break, because, amongst other reasons, the surveyor's staff work together better knowing each other from daily work.

NOTE.—A base line is, of course, necessary for a triangulation, and as it is absolutely necessary that this should be laid down accurately, and since measuring rods of precision are not often available, the author suggests that a good plan would be that a single accurate rod of a known length be held up at a suitable distance, and the distance can then be determined by calculation from the angle subtended by it—in other words, by a telemetric method. The angle should be small and an accurate theodolite used, preferably not smaller than a 5-inch. These two points should be permanently and substantially marked, as they form the ultimate basis of the entire survey.

As to obtaining the contour points, the most accurate way is to run separate lines around the basin, closing on to the starting points of the required elevations; but, as this involves considerable labor and time, it would no doubt be sufficient for ordinary mining work to run a single line of stations round the basin, midway between the working limits of the water level and at each of these stations to make a cross level, having its extremities at the limits of the water levels. Having laid down the plan of all the contour lines, it will be necessary to calculate the area of the basin at each contour. There are two ways of doing this:

(a) By dividing up each area into rectangles as large as can be fitted in, and by adding to the area of these rectangles the area of the small irregular figures enclosed between such rectangles and the bounding lines of the contour, the irregular figures being computed by means of a small planimeter. This is by far the quickest method; but, if a planimeter is not available, then we can get at the area by:

(b) Divide up the whole area into squares so small that the outer irregular spaces are practically triangles; we may treat them as such without very serious error, and we can then arrive at the area by a somewhat tedious calculation.

If the plan is drawn to a fairly large scale and great accuracy is not required, a computing scale may be used, consisting of a number of lines ruled, on a piece of tracing paper, at a definite distance apart, so as to form squares of a known area, and, if this scale is superposed on the plan, the product of the number of squares in the length and breadth respectively of the scale will give the area when multiplied with the factor = the area of each square.

It would be desirable that the scale should be rather longer than the maximum breadth of the plan and of a somewhat narrow width. The bounding lines, being irregular, must be averaged by eye into whole squares, and it is this judgment which mainly limits the accuracy of the method.

The drawing of the plan should proceed as nearly simultaneously as possible with the actual survey, and it is very desirable that the surveyor himself should make the plan. The author is specially writing with a view to wild countries, where skilled temporary assistance is unobtainable. The forenoon, for instance, may be occupied by the actual survey, and the afternoon by drawing, the native assistants then being occupied in clearing lines of sight, etc., for the next day's work.

It is usually possible in even the worst countries to find some man who is more intelligent and trustworthy than his fellows, and this man may be put in charge of a gang of peons; but tact is necessary in such a case, for, on the one hand, the surveyor must support the authority of such a foreman, and, on the other hand, must not allow himself to be in any way ruled by him, or allow the men to think that such is the case.

As to the actual construction of a dam, this is not within the scope of the present paper, but, at the risk of plagiarism, the author may give the following few hints:

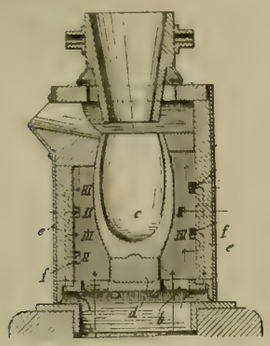
1. In sinking the foundation trench do not use high explosives, and towards the end use no explosive at all, and better not throughout, and do not stop sinking till perfectly sound, water-tight rock is reached.

2. In building the dam use only perfectly clean, sharp sand, of a variable size and medium grain.

2. If Portland cement is used, let the limit of proportions of sand and cement be 2½ to 1. But the cement should be in such proportion as to entirely fill the interstices of the sand used, after shrinkings, and use only clean water.

4. Make as good a "bond" as possible between stones, but be careful to prevent anything in the

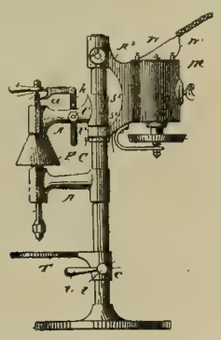
nature of horizontal or vertical joints existing in any large part of the work.



5. Never attempt to join new work on to old "set" work, but keep the old constantly wet and remove any doubtful work; it is cheaper to sacrifice a little labor and money than to endanger the stability or water-tightness of the finished work.

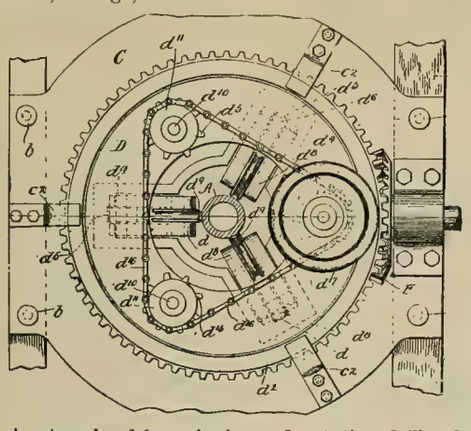
Latest Mining and Metallurgical Patents.

Patents Issued March 6, 1900.



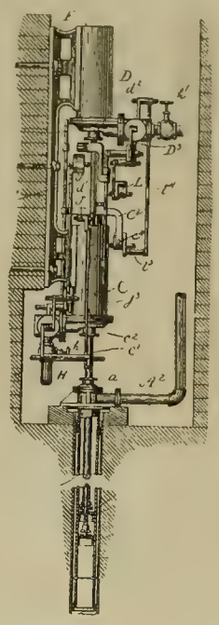
Specially Reported for the MINING AND SCIENTIFIC PRESS.

CRUCIBLE FURNACE.—No. 644,270; R. Baumann Oerlikon, Switzerland.



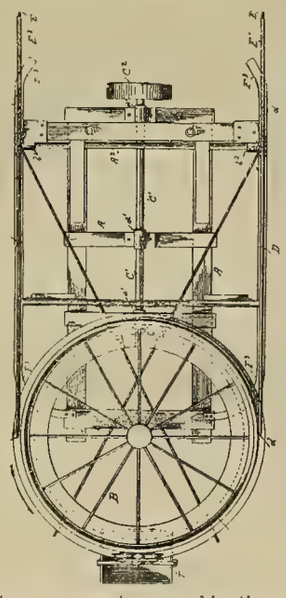
In combination in a crucible furnace of shaft rectangular in cross section, grating at lower part of shaft, crucible and air passages in corners of shaft with horizontal tuyeres extending from the several corners in different directions, the shaft having corners, passages located at corners and having tuyeres located at different levels, those of one level being directed to discharge the air in one direction around shaft and those of the next level discharging air around the shaft in other direction.

ELECTRIC DRILL.—No. 644,591; W. P. Freeman, New York, N. Y., assignor to the Empire Electrical Machinery Co.



Combination of standard, support extending therefrom, drill stock rotatably mounted thereon, friction gear secured to drill stock so as to rotate with it, motor swiveled to standard, friction gear mounted on shaft of motor armature and means for bringing two friction gears into engagement one with the other.

ROTATING DEVICE FOR ROTARY DRILLS.—No. 644,638; J. B. Rhodes, Harvey, Ill., assignor to F. C. Austin, Chicago, Ill.

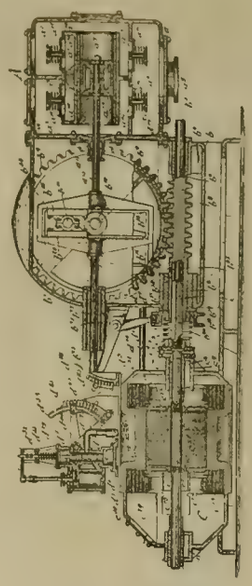


A rotary head for gripping and rotating drill rods comprising a vertically adjustable ring or centrally apertured plate through which the drill rod extends; a plurality of gripping rolls which are carried by the rotary head and adjustable for alternately gripping and releasing drill rod; a plurality of screw threaded rods or standards which are mounted upon head and which extend through openings in ring or plate; an adjusting nut on each rod, and means for connecting adjusting nuts with ring or plate; means for simultaneously rotating adjusting nuts for purpose of adjusting ring or plate along screw threaded rods in direction parallel with axis of drill rod, means for causing such adjustment of ring or plate to effect lateral adjustment of rolls relatively to drill rod, and suitable means for rotating rotary head for purpose of rotating drill.

PUMPING MACHINERY.—No. 644,618; D. H. Maury, Jr., Peoria, Ill.

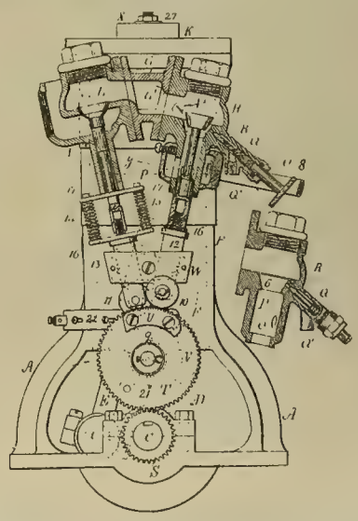
Actuating mechanism for double plunger pumps, comprising actuating cylinder, piston for each plunger and valve mechanism for admitting and exhausting fluid pressure to effect slow working stroke and quick return of each piston, comprising tappet pawl moving with each piston, two tappet arms arranged in path of each pawl and movable in succession by latter during working stroke of its piston, and reversely arranged lever connections between each pair of tappet arms and valve which controls movement of other piston to that which actuates pair of tappet arms.

ROPE TRAMWAY SYSTEM.—No. 644,675: J. T. Ludlow, San Francisco, Cal., assignor to Vulcan Iron Works, San Francisco, Cal.



A rope tramway system, combination with track ropes, transfer device located at terminal end of system; switch rails leading onto transfer device, switch movably attached to each switch rail, connection between each switch and track ropes, and means for imparting rotary motion to transfer device; and independent means for conveying carriers onto transfer device and removing same therefrom, whereby carriers are automatically shifted from one track rope to the opposite one; switch rails leading onto turntable, a switch movably connected to outer end of each rail, and connection between each switch and the track ropes.

SOLVENT FOR LEACHING ORES.—No. 644,770; R. W. Kennedy, Ashland, Or.



Solvent for leaching ores, comprising sodium thiosulphate, ammonium carbonate and copper sulphate in water, with addition of phosphoric acid, potassium cyanide and sodium or potassium acetate.

ELECTRIC PUMP.—No. 644,852; C. Eickemeyer, Yonkers, N. Y.

Combination, with electric motor and pump operated thereby, of hydraulic regulating device for motor, pipe for conducting fluid thereto directly from delivery chamber of pump, whereby fluid pressure in delivery chamber is transmitted to and automatically operates regulating device, safety armature resistance, supplemental or auxiliary to regulating device, and means interposed between pump and motor for throwing more or less resistance into armature circuit.

GAS ENGINE.—No. 645,044; A. T. Otto, Chicago, Ill., assignor to R. L. Stevens, Hoboken, N. J.

Combination in a gas engine, of cylinder having lateral hollow projection and port with side faces inclined in opposite directions, induction and eduction valves and chests connected upon inclined faces of hollow projection and inclined to each other on radial lines, or nearly so, extending to actuating wheel, a gear on crank shaft and second gear driven by same and forming actuating wheel, cams upon such actuating wheel, rollers and slides for opening respective valves and springs for closing such valves.

TEN years ago an electrolytic bath for the depositing of copper contained 75 to 100 times as much metal in solution as was deposited in twenty-four hours; these figures have been reduced to one-fifth of the values stated, thus the proportion of the metal obtained in the wet way has been greatly increased; the world's daily production is now estimated at 500 tons of electrolytic copper. One of the earlier plans of increasing the output was that introduced by the Elmore Co., in which an agate burnisher was caused to continuously pass over the surface on which the deposit was being made. The resultant metal proved to be of great strength. In a more recent development a sheepskin, impregnated with animal fat, is used as a burnisher. S. Cowper-Coles of London has hit upon another plan, described and illustrated in the issue of the 3rd inst., in which the copper is deposited upon a vertical mandril, caused to rapidly rotate. The centrifugal force developed and the wash of the electrolyte over the rotary surface keeps the latter clean and free from gas, and a smooth and dense deposit has thus been obtained with current densities approaching 200 amperes per square foot.

Notes on Ore Dressing.

NUMBER III.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by A. W. WARWICK.

Some years ago the writer was in charge of a testing works erected by Bowes Scott & Western in London, Eng. In these works was a full-sized crushing plant with a capacity of about fifty tons quartz per twenty-four hours through a 30-mesh screen, and of course a much higher output for the coarser screens. This is mentioned to show that the plant was not a toy; it was a perfectly arranged, gradual reduction system. Two series of tests may be given showing the character of work: in one case the run was of forty-five tons and in the other a run of seventy-five tons was made, and the samples taken fairly represented the average. The first ore consisted of galena and blende in a quartz and shale matrix, and was crushed to a 10-millimeter screen. The result of the crushing is shown by the following figures:

Ore crushed to 10-millimeter screen—

Ore between	6.5	and	10	mms., 35.3%;	lead, 2.3%;	zinc, 6.8
" "	4.0	"	6.5	" 21.7%;	" 3.4%;	" 7.1
" "	2.5	"	4.0	" 13.8%;	" 3.8%;	" 8.9
" "	1.0	"	2.5	" 18.0%;	" 3.9%;	" 9.1
" "	0.25	"	1	" 7.5%;	" 4.2%;	" 9.0
Finer than 0.25 mm				3.7%;	" 5.5%;	" 9.8
				100.0		

The other ore was crushed to a 3-millimeter screen and consisted of very pyritic quartz—

Ore between	1	and	3	mms	40.8
" "	0.8	"	1	"	20.1
" "	0.4	"	0.8	"	17.8
" "	0.25	"	0.4	"	9.8
Finer than 0.25 mm					11.5
					100.0

If the first of the above given screenings be compared with those given by Munroe and those in the Northumberland mill it will be seen how much better work can be done by a judicious arrangement of machinery.

As an example of a first-class crushing plant, the Harney Peak mill for concentrating tin ore may be given. This mill, near Hill City, S. D., is a monument of what a well-designed mill should be. In this mill the ore is crushed to a 2½-inch ring in a 15x9 Blake and then screened in a trommel with 1¼-inch perforations; the coarse goes to a 7x10 Blake, set up fine. The fines from the trommel and the product from the Blake is then crushed in two sets of geared rolls and from these go to a ⅝-inch trommel. The stuff passing ⅝-inch trommel goes to the mill and the rejections to a set of finishing rolls which finally reduces all ore to the desired size.

It will be seen that in this mill the ore is gradually brought down without unduly crushing the valuable mineral cassiterite.

At the Minah mine, Montana, managed by the writer, a gradual reduction plant was working on a silver ore. At different times the fineness to which the ore was crushed was varied; 20-mesh, 25-mesh, 30-mesh screens were used. The ore was first crushed in a rock breaker to about 1-inch cubes. The resulting product was of the following character:

					Per ct.
Coarser than	16-millimeter		screen		65.5
Between	5	and	16	" "	27.2
"	1	"	5	" "	3.2
"	0.75	"	1	" "	1.1
Finer than	0.75			" "	3.0
					100.0

This product was sent to a set of roughing rolls of Krom's make, speed eighty revolutions per minute. After leaving these rolls the ore was screened in a 5-millimeter trommel; the coarse was sent to a set of finishing rolls of Krom type, the fines were sent to the finishing screens. The ore reduced fine enough was then removed to the ore bins, while the coarse was returned to the finishing rolls. The ore from the finishing rolls joined that from the roughing rolls and went to the screen system. The following were the results of crushing:

	Ore from 1st Rolls Before Screening.	Ore to 2nd Rolls.	Ore from 2nd Rolls Before Screening.
Coarser than 10-screen	73.4	27.4	26.0
Between 20 and 10 "	11.8	63.4	22.6
" 30 " 20 "	4.8	8.8	39.8
" 40 " 30 "	3.2	0.4	3.8
" 50 " 40 "	2.4	....	3.4
Finer than 50 "	4.2	....	4.4
	99.8	100.0	100.0

The result of this system of crushing was a very even-grained product and comparatively free from slimes. At different times screens of varying mesh were used and the following screenings were obtained:

SCREEN.	—20-MESH.— Per ct.	Assay for Silver, Ozs.	25-MESH. Per ct.	—30-MESH.— Per ct.	Assay for Silver, Ozs.
Ore between—					
30 and 20-mesh.	49.8	11.0	14.4	.....	....
40 " 30 "	15.5	13.0	21.7	24.5	11.2
50 " 40 "	18.6	13.5	33.9	25.5	14.0
100 " 50 "	1.2	16.4	7.8	7.0	17.7
Finer than 100	14.0	20.2	22.2	43.0	22.5
	100.0		100.0	100.0	

This plant crushed dry and in order to keep down dust the screen chambers, etc., were connected to an exhaust fan. The dust thus drawn off was collected in large dust chambers. This dust assayed from 24% to 28% silver per ton.

It may be of interest to note the output of the Minah crushing plant when using different screens. When using 20-mesh, 26 B.W.S. wire the output was 4¾ tons per hour; with 25-mesh, 28 B.W.S. wire the output was 2⅝ tons; with 30-mesh, 30 B. W. S. wire the output was 1¾ tons. For a short time a 16-mesh, 22 B. W. S. wire was used and the output was about 6½ tons, but the plant was incapable of being fed to its utmost capacity, owing to the ore spouts and launders being of insufficient size. The power required was 50½ I. H. P. Thus:

	I. H. P.
Friction, including engine	18.5
Rolls, two sets	17.4
Rock breaker	7.9
Screens and elevators	6.7
Total	50.5

This power is for all practical purposes constant, whether the mill is crushing to 20, 25, or 30-mesh screens—that is, of course, when it is being run to its full capacity.

Rolls are by no means the only machines used for crushing ores for concentration in ore dressing. At one time or another practically every crusher invented has been used with more or less success. Practically, however, if rolls are not used, recourse is made to stamps—that is, for fine crushing. In gold milling, of course, the gravitation stamp is without a rival, but in the large mills of the Anaconda and in Michigan the steam stamp has driven it out. In spite, however, of many advantages, there can be but little doubt that both types of stamp will eventually be driven out of the concentration mill, except in special cases. However, where the mineral to be saved is tough or hard, no doubt they will be continued in use for a long time. The gravitation stamp, used simply as a crushing machine, is necessarily somewhat modified from the form used in gold milling, in which latter case it is used as an amalgamator as well as crusher. The mortar is naturally very narrow and with a low discharge—in fact, both modifications are carried as far as possible, the limit being set by the increasing wear and tear of the screens.

The stamp is far removed from our ideal of a crushing machine, from the point of view of the ore dresser. The action is very violent and breaks down the mineral particles to an excessive degree. Even in cases where the mineral is as hard, or nearly so, as the matrix, yet by the concentrating action of the mortar the mineral is broken down much finer than is necessary. As an example of this, the tin ore of Cornwall may be given. Here we have a case of a very tough mineral in a tough matrix. The stamps used are very crude and of small capacity, not averaging more than about one-half ton per stamp head per twenty-four hours. A sample of crushed ore from the Cook's Kitchen mine, Cornwall, was tested some years ago by the writer.

Ore between—						
30 and	25-mesh	screen,	1.0%,	value	12	lbs. tin per ton.
60 "	30 "	"	7.5%,	"	12½	" " " "
80 "	60 "	"	25.5%,	"	14	" " " "
100 "	80 "	"	4.1%,	"	16	" " " "
Finer than	100	"	61.9%,	"	21	" " " "
			100.0%			

This ore was worth about 18½ pounds tin per ton. On crushing, as shown by the screenings, about 75% of the value was put into the slimes. It need scarcely be wondered at that the loss of mineral is from 12% to 20%, or an average say of 15%. Were it not for the great skill of the Cornish tin dresser, however, the losses would be much greater.

As an example of the crushing done by a California stamp mill the work of a 10-stamp mill near Danby, Cal., may be given. The ore is porphyry with seams of oxides of iron and iron pyrites running all through it. The ore is quite soft. Weight of stamps 850 pounds, 6-inch drop, 7-inch discharge, crushing to 30-mesh, B. W. S. wire.

Between	40 and	30-mesh	0.41%,	value	$3.55,	% pyrites 1.2
"	80 "	40 "	9.55%,	"	4.75,	" 1.8
"	100 "	80 "	10.58%,	"	5.85,	" 3.45
Finer than	100	"	78.75%,	"	5.90,	" 3.60
			98.99%			

Although this is hardly a fair example of the average work of a California stamp mill, owing to the soft character of the ore, yet it may be seen that about 89% of the pyrites went into the slimes.

Another set of screen analyses made by the writer on the Drumlummon, Montana, mill pulp gave somewhat better results. The ore is very hard quartz; 750-pound stamps, 8-inch drop, 30-mesh wire screens. The pulp on screening gave these results:

Between	40 and	30-mesh	2.79%,	pyrites, etc.,	1.35
"	80 "	40 "	24.80%,	" "	1.60
"	100 "	80 "	9.78%,	" "	1.72
Finer than	100	"	62.60%,	" "	2.21

In this case we again see that the fines give by far the highest proportion of mineral values.

Possibly the most complete experiment made on the relative efficacy of stamp and roll crushing, for concentration and ore dressing, is that made at Pzribram, Bohemia, some years since:

	Rolls.	Stamps.
Ore treated	600 tons.	600 tons.
Lead ore obtained	20.923 tons.	26.52 tons.
Value concentrates	3101 florins 42 kr.	2821 florins 95 kr.
Deduction for zinc	575 " 29 "	816 " 27 "
Net val. concentrates	2526 florins 13 kr.	2005 florins 68 kr.

The lead ore was made up as follows:

Rolls—

10.251 tons	grain ore, containing	40 %	lead, 10.9%	zinc.
10.672 "	slimes "	"	15.8% " 21 %	"
20.923 tons.				

Stamps—

6.235 tons	grain ore, containing	18 %	lead, 18 %	zinc.
20.285 "	slimes "	"	15.5% " 21 %	"
26.250 tons.				

These carefully conducted experiments* show that the machine producing the least slime will, other things being equal, give the best product. In both cases the slimes were of practically equal value per ton, but the rolls produced only one-half of what the stamps produced. This test certainly shows a remarkably higher efficiency for the rolls, and there is no doubt that the results are directly due to the smaller amount of fines made by them as against the stamps.

To summarize the foregoing, it seems that gradual reduction of ore to the desired size will be a feature of the modern mill. Modern practise in all branches of industry tends to the ascertaining of the exact nature of the work to be done and then to adapt the machinery to the case in point so that the best results may be obtained at the least cost. Undoubtedly, in the newer mills the crushing department will be regarded as distinct a division as the engine room itself. Mere capacity of the crushing plant and a low cost of handling, regardless of the product obtained, will not be the ruling ideas. Given a well-crushed product the whole of the after operations are rendered simpler, more efficacious and therefore cheaper.

While considering the nature of the crushing required it may be well to consider what may be called the secondary crushing department. In the process of separation a fairly large quantity of material is made, consisting of "middlings." These, from the machines treating the coarser grades of broken rock and mineral, consist partly of fragments of pure minerals and partly of fragments of intermediate specific gravity, due to the particle being made up of two or more minerals. In this latter case the mineral can not be further separated without finer crushing, and this is usually done by crushing machines independent of the primary crushing machinery. This, of course, is in larger-sized plants; in a small mill these middlings are returned and take their chance of being crushed finer in the primary crushing machines.

If a secondary crushing plant is necessary, the interesting question arises whether it would not be the best policy to crush the whole of the rock more coarsely and thus to make more of these middlings. The points in favor of this scheme are: (1) At one operation a large amount of barren material is removed. (2) The amount of slimes made is greatly reduced. (3) The cost of crushing would not be so great.

There is much to be said in favor of this system and it undoubtedly should receive consideration in the design of large plants intended to handle low-grade ore or where the mineral is hard to save. The writer hopes at some future time to recur to this subject.

*J. Habermann—Berg und Huttenmannisches Jakebuch der K. K. Bergakad, zu Loeben, etc., vol. 30, p. 1.

Improvements in Steam Engine Practise.

Consul-General Mason of Frankfort, Germany, says some German professors have succeeded in devising a plan by which a large quantity of the energy in the shape of low-powered steam is saved and utilized by the new process. Liquid sulphurous acid, acted upon by the latent heat of the waste steam given off from a compound engine, is utilized to run an auxiliary engine, and some remarkable statements as to the value of the process are made. In the plan mentioned the exhaust steam passes into the surface condenser, or vaporizer. In this vaporizer the cooling medium used, instead of water, is liquid sulphurous acid, which has a boiling point so low that it is immediately decomposed by the heat of the exhaust steam, whereby the sulphur dioxide gas is liberated, which passes over into the cylinder of the auxiliary engine where its work is done as in an ordinary steam engine. By this invention the steam power is increased to the extent of 56%, and, instead of yielding only 1 H. P., 1½ H. P. is capable of develvopment, the extra ½ H. P. being applied by means of the auxiliary engine. Little added expense is said to result from the use of the new plan, and it may prove commercially successful.

MINING SUMMARY.

ALASKA.

A stampede from Nome northward is the latest, men preparing to go from there 100 miles farther north, and to the Siberian coast opposite. Large numbers are preparing to leave San Francisco and coast ports for Cape Nome next month.

ARIZONA.

MOHAVE COUNTY.

(Special Correspondence).—In the early days of the American Flag mine, situated in the Wallapai mountains and owned by four Cornishmen, of whom Monte Pemberthy is the survivor, they packed their ore from the mine to Hardyville, on the Colorado river, thence it was sent down the river, through the Gulf of California and up the Pacific coast to the Selby Smelting Works in San Francisco, at a cost of $11 6 per ton. For especially rich ore the cost was as high as $160 per ton. This property has produced $400,000. The same condition obtained at Chloride, Stockton Hill, Cerbat and Mineral Park.

At Chloride, when silver float was discovered, many shallow holes were dug, the rich surface ores extracted and shipped by "chloriders." Hence the name "Chloride." An adobe town flourished for several years, but was superseded by Mineral Park, Cerbat, Stockton Hill and other districts.

The Tennessee mine, bought by E. T. Loy two years ago for $5000, is being worked. The deepest shaft is 350 feet, where the vein is from 5 to 25 feet wide and runs 54% lead, twenty-two ounces silver and one-fourth of an ounce in gold. Eighteen thousand gallons of water are daily taken out of the mine, which is used over and over again. Twenty to thirty cars of concentrates are shipped per month. The mine gives employment to fifty-five men.

The Lucky Boy, owned by Chicago people, T. B. Scott and others, is down 180 feet and has 6 feet of ore in a crosscut, which carries silver running from 159 to 800 ounces and from three to as high as twenty-five ounces in gold. The present owners purchased this property in August last, paying $15,000 for it.

The Pay Roll is under bond to Colin Timmons of Leadville, Colo.

The Badger, owned by Cleveland people, is working ten men.

The Juno M. Co., with E. T. Loy Mgr., has a shaft 340 feet deep and has a level at 220 feet and 320 feet in good ore. This property in former days shipped $400 ore to San Francisco. A fine steam hoist is on this property.

The Merrimac, owned by Philadelphia people, consists of two claims and has the deepest shaft in the district, 450 feet. It has a 50-ton concentrator, seven to eight tons being put into one. Thirty men are employed and the property was bought less than two years ago for $7500.

The Empire No. 2, owned by G. W. Beecher and E. F. Thompson, has a vein width of 30 feet at a depth of 150 feet and the pay streak is between 2 and 3 feet wide, running in silver and lead.

In the White Hills district, sixty miles north of Kingman, twenty men are at work on a new body of ore, which under the present management will be worked systematically.

At various points along the Colorado river placers and gold quartz claims are being slowly opened up.

Chloride, March 10.

CALIFORNIA.

AMADOR COUNTY.

Supt. Porter of the Baliol mine, Sutter Creek, says the mine has been sold to a German syndicate.

CALAVERAS COUNTY.

(Special Correspondence).—The copper mines known as the Satellite and the Penn Chemical Works are now known as the Penn M. Co.'s property, owned by the Penn M. Co. A. C. Harmon is Supt. A furnace is in successful operation.

Campo Seco, March 13.

MARIPOSA COUNTY.

(Special Correspondence).—On the Mariposa Grant bottom has been struck in the old shafts, both at Princeton and Mariposa. The former is reported looking well, but in the Mariposa the shoot has gone out.

Development on the Pine Tree and Josephine at Bear Valley continues and both mines are looking, if anything, better than was expected. A meeting of the owners will soon occur on the property, when plans for more extended operations will be matured. It is reported and denied that the electric power plant at Merced Falls has been purchased, together with the machinery now on the Mt. Gaines, for use at Princeton.

The Nameless M. Co. is developing the Bonanza and Elizabeth claims in White's gulch.

A. P. Dron of Big Oak Flat has an option on the Red Cloud and will pump it out at once. This was once the richest mine in Mariposa county, but at the 600 level the ore shoot was lost. Five years ago a Boston company spent $60,000 between the 600 and 700 levels in an unsuccessful search for it.

The Quail remains closed in a tangle of lawsuits and attachments, workmen and local merchants holding unpaid claims to the extent of about $3000.

The Columbus has been virtually idle since Jan. 1st, though work on the power plant continues.

Three companies, with about twenty men, are working in the Bull Creek district.

The Egenhoff mine on Hall's gulch has cut the vein in the low level tunnel and has 3 feet of high-grade ore.

The Sierra Buttes Co. has closed the Tendron at Whitlock's for an indefinite period.

The Merced Co. is sinking the main shaft of the Mary Harrison from the 700 level and has about reached the 800, where a station will be cut. A winze is also being sunk in the vein from the 700 to the 800 and is in fine looking rock. A long crosscut is also being driven into the hanging wall country. No available ore was left in the mine above the 700 when the mill stopped on Jan. 1st, and it is not expected the mill will be run during the current year. The cave, which at one time threatened to close the mine, continues to some extent.

Brown & Rogers have bonded their Pinon Blanco property to Ph. Deidesheimer.

There are reports that the Tyro is to be unwatered for examination.

The Alice Clark is closed indefinitely. The mine was never in good repute locally, but a well-to-do Stockton syndicate were led into equipping it with machinery and mill and made considerable development on it, without success.

The suit pending in San Jose against the promoters of the Golden Crown-Big Betsey deal by some of their patrons excites much interest locally. The character of the deal was notorious throughout Mariposa county and the incredible statements in the prospectus should have put any resident of a mining State on his guard.

Bear Valley, March 5.

KERN COUNTY.

(Special Correspondence).—The Warrington M. Co., at Havilah, has been attached by U. T. Smith. The Warrington Co.'s officials and owners of stock are in St. Paul and Minneapolis and the work has been carried on by R. C. Shaw. Mr. Shaw resigned and G. Thede has charge of the property. The mine had been worked to a depth of 400 feet, and prospects were so favorable that machinery and material were placed on the mine while work of construction, etc., was in progress. The mine, being unpatented, became jumpable, and P. O'Brien jumped it, stood a large number of men off with a Winchester, being stationed in a tunnel, and the company lost the property. Later, W. H. Blaisdel of Yuma bonded the mine and spent $30,000. The property fell into the hands of D. S. Lightner and he sold it to Los Angeles parties and they to the present company. The mine is considered to be rich, and poor management has kept it from being on a paying basis. It is the intention of the present company to push down a deeper shaft. They now have equipped a 10-stamp mill and complete cyanide works.

Caliente, March 10.

Randsburg reports scarcity of water; the Yellow Aster mill has shut down half its stamps. Capt. Collins, who purchased the Black Hawk mine, has developed water between Randsburg and Garlock, and proposes to lay pipes eight miles. He is locally credited with intent to add thirty more to the thirty stamps in that mill and build a 30-stamp mill at his mine three miles from Cuddeback lake.

MONO COUNTY.

In 1899 the Standard mine of Bodie produced $422,615. The amount of ore reserves in the mine is estimated at 6400 tons.

NEVADA COUNTY.

(Special Correspondence).—At the Gold Hill mine, Grass Valley, good progress has been made since work was resumed. The shaft is 200 feet deeper, making it now 1250 feet. Drifting goes on at the 1200 level. A 250 H. P. synchronous motor has been substituted for one of less power to drive the air compressors, of which there are two—one of 140 H. P., the other of 70 H. P. A direct-acting electric hoist has also been added. Formerly the hoist was run by compressed air, and the engine therefor, with its attachments, still remains in place and can be resorted to in case of need. The mine is heavily watered, but the water is handled in good shape by Dow pumps stationed at various levels in the shaft. These pumps are run by compressed air, as are the machine drills, the air being re-heated before use. No mine in the county relies more fully upon electric power than the Gold Hill, though it has a steam plant to fall back upon in case of an emergency. E. W. Hopkins has been prospecting this mine since 1896, having been encouraged thereto by its early history. It had been idle for many years, and of course had filled with water. R. Walker is Supt.; C. T. Rounes, chief engineer; R. F. Barry, foreman.

The Pennsylvania mine, on Ophir Hill, near Grass Valley, has a model plant for one of its capacity. Over one year ago a new 10-stamp mill replaced one of the same capacity. Since then new hoisting works have been completed, as well as one of the Gates' slime plants. The new double-reel friction hoist, run by steam, is a fine machine. The pumps are also run by steam. Electricity is the motive power in the mill, where, besides the stamps, there are three Johnston concentrators. All of the buildings, except a new and commodious office, are sheathed with corrugated iron, painted lead color. This mine has been developed entirely by local stockholders. They paid assessments for many years, but for the past three years they have been receiving liberal dividends. The ore ranges in value from $20 to $30 per ton; 700 feet is the depth of the shaft. B. Opie is Supt.; A. Argall, Sr., foreman.

The Coe mine, in the eastern outskirt of Grass Valley, is being reopened, and will be one of the active enterprises of the district. Nothing had been done on the property for many years, and the mine had filled with water. Its early history, together with the excellent character of the outcropping vein, encouraged an Eastern company, headed by O. A. Turner, the Supt., to buy the property for cash. Their first work was to reconstruct the old buildings and revivify the old pump. Pumping began last November. Since then the shaft (540 feet deep) and drifts have been unwatered. Some retimbering in the shaft was necessary. I found in each of the drifts a well-defined ledge of ribbon quartz, from 1 to 3 feet in width, between walls of grano-diorite and serpentine. Comparatively little stoping had been done by early workers, leaving this almost unworked. The company will build a 20-stamp mill. W. S. May will superintend its erection. New and improved machinery will be procured for the hoist. Electricity will be the motive power. The works are situated within a few yards of the power line of the Nevada County Electric Power Co. The company will begin sinking at once. They expect to have 100,000 tons of ore ahead by the time the mill is ready.

Grass Valley, March 12.

With the new pump at the Merrifield Supt. Zeitler says he can sink 3000 feet.

PLACER COUNTY.

(Special Correspondence).—At the Bellevue mine, near Ophir, a new Cornish pump has been started, and the mine is being unwatered preparatory to development work. The hoist and pump at this mine are both run by a 36-foot overshot water wheel. After the water has been taken out of the 200-foot shaft it will be sunk 100 feet deeper before any drifting is done. Then twenty men will be employed. The same company owns the Bullion, an adjoining location, where there is a vertical shaft 120 feet deep. Work will be resumed here later in the season. These claims are owned by Auburn business men.

Houchin & Dixon, on an extension of the Conrad, one and one-half miles from Auburn, are sinking an incline shaft on the ledge, and are now down 160 feet. They have run a drift both ways from their first level (80 feet) and are now 70 feet from the shaft at their second level (160 feet). They are taking out fine-looking quartz, which is being milled at Malmsberg's 5-stamp custom mill, one-fourth mile distant from the mine. They have a 2-foot ledge of quartz between slate walls.

Work has begun at the Big Bonanza mine, formerly the Eureka and Eureka Extension, two miles south of Auburn. A new shaft has been started upon a shoot in a 6-foot ledge which outcrops boldly at the surface. The ledge had been prospected through tunnels at various places in former years, but there was no capital behind the work. Present operations are being pursued by people who can put in a good plant if developments warrant. W. C. Hooper is foreman of the work, with ten men employed.

At the Hidden Treasure gravel mine, near Michigan Bluff, the management has finished the installation of a new electric plant for pump and hoist at the inside station, one and one-half miles from the mouth of the tunnel. Power is derived by connecting with the trolley wire which supplies energy for running the electrically propelled ore cars. The hoist runs 32 feet to a second channel recently discovered, and twenty tons of gravel per hour can be raised.

Auburn, March 10.

SAN DIEGO COUNTY.

The Golden Cross is again in court. J. D. Hanbury sues to recover $5000 expenses and $295,000 commission. He claims that the company contracted with him in January, 1896, to find a purchaser for the property at $3,500,000. Any valuable mining property is liable to be similarly attacked.

SHASTA COUNTY.

(Special Correspondence).—Near Shasta, Murray Bros. & Co. are developing an 18-inch ledge of high-grade ore and are making shipments to the Keswick smelter.

The Appel mine, near Keswick, has begun ore shipments. They are operating under bond and lease, paying a royalty of 8% of smelter receipts.

In a canyon of the Corinne mine three nuggets were found last week weighing $14 each.

The Oro Vista Co. continue development on five claims, in one of which a 30-inch ledge of high-grade shipping ore has been opened.

The Gray Eagle mine, near Shasta, is developing a 7-foot ledge of low-grade smelting ore.

On the Black Spider mine, near Keswick, the shaft is in footwall country, faced in syenite carrying auriferous pyrites and chalcopyrite, running $9 a ton. Station cutting and drifting will be in progress in another week at 100 feet depth and shipments begun to the Keswick smelter.

The DeLamar Co. is about to build a steel bridge across Pitt river on the road from Redding to Bully hill.

The Mountain Copper Co. has a large force developing the recently acquired Stowell property, near Copley.

Christensen & Carlson are shipping ore from the Orpheus mine at Muletown to the Keswick smelter.

Redding capitalists have organized to establish an electric power plant on Pitt river, twenty-five miles north of Redding, to furnish power to mines and light for Redding. To date $25,000 has been subscribed. It is expected that $75,000 additional will be signed this week.

Redding, March 12.

(Special Correspondence).—Work has begun on the second smelter in this county at the Bully Hill mine, twenty-two miles from Redding; daily capacity, 200 tons. Unlike the matte product of the Keswick smelter, which has to be shipped to New Jersey to be refined, a converter will be put in at Copper City—the name of the site of the plant—and the matte will be refined there, the first of the kind in California. The product of the converter will be black copper about 97% pure.

At Keswick the Mountain Copper Co. has raised miners' wages from $2.75 to $3 and muckers' from $2 to $2.50.

Redding, March 14.

SIERRA COUNTY.

A hundred more good mine leasers could find employment at Hillsboro, says the Advocate.

SISKIYOU COUNTY.

The Journal reports that the river miners along the Klamath are preparing for reopening claims, building wingdams and putting in wheels. The heavy freshets have cleaned the river of tailings and rock piles, thus allowing better opportunity in sinking to bedrock of the river channel, where rich pay is found.

The Portland Extraction Co., on Salmon river, has a plant for the treatment of low-grade ores and sulphurets. H. A. Townsend is Mgr.

TUOLUMNE COUNTY.

(Special Correspondence).—They have just struck the ledge at the Clio mine through a crosscut on the 100-foot level. The vein is 8 feet wide and shows free gold all the way across. There is a 4-foot gouge on the foot wall that will pay at least $10 per ton. The company will put in a large hoist at once. J. E. Potter of Boston is part owner and Mgr. of the mine, and T. W. Webb foreman.

Jacksonville, March 13.

(Special Correspondence).—The new 10-stamp mill of the Mount Jefferson has commenced crushing. Its erection has been delayed on account of the weather, it being desired that the foundation be in proper condition. The stamps weigh 1100 pounds each. The Mount Jefferson has been extensively developed under the conservative management of J. M. Meighan for three years, and it is intended to increase the crushing capacity gradually. The main incline is 350 feet in depth. At the 300-foot station the east level is 350 feet long and the west level 200 feet. At the 200-foot station the east level is 270 feet in length and the west level 175 feet. The pay ore is from 5 feet to 6 feet thick

and is expected to yield $18 per ton in gold.

At Big Oak Flat the Accidental (the west extension of the Longfellow) is also being developed in a substantial manner. The main incline is 320 feet deep. Ph. Deidesheimer is now its Supt.

Groveland, March 12.

Supt. Hardy of the Santa Ysabel favors raising funds for further exploration work. He says that the surface equipment at Santa Ysabel is equal to any in that section, and that the recent experience of that mine has been but the experience of many mines in that region, now profitably worked.

COLORADO.

BOULDER COUNTY.

At the Cold Spring mine, Gold hill, Boulder, the tunnel is in 1100 feet. At the point of intersection the breast of the tunnel will be 650 feet below the surface. An electric exhaust fan at the bottom of an old shaft, which intersects the tunnel 300 feet from the mouth, works with a speed of 2000 revolutions per minute and exhausts the powder smoke from the breast of the tunnel in thirty minutes.

CLEAR CREEK COUNTY.

At Georgetown the Doric Co. will spend $50,000 to further prospect the hill and those veins already cut. Some drifting on one vein has opened a body of mill ore.

CUSTER COUNTY.

The Bassick mine, near Querida, has been unwatered, retimbered and repaired, the shaft sunk 100 feet deeper, opening up ore on which men are drifting. The old machinery is being replaced with modern appliances, and the property is expected to be a producer this summer.

FREMONT COUNTY.

The Milliken ore reduction mill, to be built at Florence, will be 350x550 feet. An electric plant will furnish power, by which all the departments will be operated. The electric generator will be driven by a 500 H. P. engine. There will be storage bins to accommodate 5000 tons of ore, six 40-foot roasting furnaces and eight 12½-ton chlorination barrels, with a concentrating plant of thirty tables. The daily capacity will be 300 tons.

LAKE COUNTY.

In the Midland at Leadville is a remarkable ore body, the vein in the contact above the lime being between 3 and 4 feet wide of chlorides that run 1000 ounces silver to the ton. It has been opened for 30 feet.

The manager of the Yak tunnel says there will be no cessation of work until the Ibex properties are reached.

The Boston Gold-Copper Smelting Co. is a concern independent of the smelter trust. Plans are under consideration to increase its capacity from 200 to 1000 tons per day.

MINERAL COUNTY.

At Creede the Ridge mine has resumed and employs fifty men.

SAN JUAN COUNTY.

E. G. Stoiber has bought the South Side and Gold mining claims, adjoining his San Juan property.

TELLER COUNTY.

The Eclipse No. 1, New Haven, shows a 6-foot vein carrying quartz seams and sylvanite.

The Standard Oil Co. are still developing Copper mountain.

The Hood Carbonate is to have a large steam hoist.

The Monarch Co. has begun work on a new shaft on the Minnehaha.

The Woods Investment Co.'s new purchase, the Mabel M., of Beacon, has 2 feet of good ore in the bottom level, and soon will begin making regular shipments to the smelters.

IDAHO.

OWYHEE COUNTY.

The Avalanche hears that W. H. Dewey has sold all his stock in the Trade Dollar Con. M. Co. for about $1,000,000 cash.

MONTANA.

BEAVERHEAD COUNTY.

Gen. Mgr. Knippenberg, Hecla Con. M. Co., Glendale, in his annual report, says: "A review of our operations for the year 1899 shows most unsatisfactory results, arising from the fact that we did not have ore in sufficient quantity. The small profit realized from the year's business is shown by the following:

Total receipts from sale of product, etc	$199,556 04
Expenditures for the year.	187,092 90
Net profit, 1899	$12,463 14

"In August we purchased the Condor, Pride of the West, Minnie Gaffney and Moffat & Maynard mining claims for $12,250. The above item, 'expenditures for the year,' does not include this amount, nor Dividend No. 146 ($15,000); these do not belong in the expense account. In December, 1899, conditions at the mines promised fairly good results for that month, and January and February, 1900, likewise. Considering these circumstances, the board of directors concluded to take some risk, and declared a 1% dividend, $15,000, to be paid to the stockholders on Dec. 23, hoping they might pay another in January, and, possibly, one in February. Their expectations were not realized. By Dec. 23 the daily ore supply was exhausted and it became necessary to close down the smelter, perhaps for a month, or even longer." The product of the mines in 1899 was as follows: Lead bullion, 838,894 pounds; copper matte, 155,719 pounds; silver, 249,738.27 ounces; gold, 219,155 ounces. S. A. Barbour, Supt. of the mining department, reports in part as follows: "The cost of mining the first-class ore, taking the above total expenses, was $30\frac{623}{1000}$ per ton. The increased cost of mining was due to the greater amount of prospecting or dead work to find ore, and also to the smallness of the ore when found, making the mining of it more expensive."

CASCADE COUNTY.

The Boston & Montana C. C. & S. Co., in its annual report for the year ending Dec. 31, '99, shows:

ASSETS.

Cash and accounts receivable at Boston, and copper, silver, gold and bluestone sold but not paid for	$5,507,830
Cash and accounts receivable at Butte	73,748
Supplies on hand at Butte	287,294
Cash and accounts receivable at Great Falls	1,926
Supplies on hand at Great Falls.	275,123
Total assets	$6,145,921

LIABILITIES.

Accounts payable at Boston	$483,584
Accounts payable at Butte	340,920
Accounts payable at Great Falls	215,910
Accrued interest on bonded debt	9,415
Total liabilities	$1,049,829
Balance of assets Dec. 31, '99	$5,096,092

In his report the superintendent says: "The total amount of advance in the development aggregates 28,757 feet, or nearly five and one-half miles. In addition, 18,525 cubic sets were removed from the stopes.

"The amount of ore in sight Jan. 1, '99, was estimated at 2,161,597 tons, while we estimate the reserve in sight and undercut on Jan. 1, 1900, at 2,500,000 tons. In this connection it should be stated that such large reserves necessitate a corresponding expense of maintenance, and therefore during '99 the intention was to so proportion the development to ore extraction as to maintain the reserves at about 2,500,000 tons.

"The contemplated construction for the coming year will be: A new hoisting engine for the Mountain View shaft, which should be powerful enough to operate from a depth of at least 2000 feet greater than present depth; a new pump for the Leonard shaft, powerful enough to pump ultimately 1250 gallons per minute from the twelfth level. When this is erected the pump which is now at the sixth level of the Leonard will be used at some other mine. Underground and on surface considerable improvement has taken place, and in general the mines are in a very efficient state.

"At Butte we have continued to lease and operate the Butte & Boston smelter. The operations and costs have been satisfactory throughout the year. On Feb. 1, 1900, the Boston & Montana Co. turned over this smelter to its owner, the Butte & Boston Co. The capacity of the new No. 7 furnace has been brought up to 165 tons per day, and with careful work it can be kept to average this for months at a time. It will take nearly the whole of this year to complete the contemplated construction. When completed the capacity of the plant will be increased about two-thirds, and in case of necessity we believe the plant could treat double our present quantity of material. The increase will depend, of course, on the grade of ore treated."

The company has paid the following dividends: On July 28, '88—its first—$2 per share; in '89, one of $2 per share and three of $1 each; in '90, two of $1 and two of $1.50; in '91, four of $1; in '94, two of $1; in '95, one of $2 and one of $5; in '96, two each of $2 and $3; in '97, four of $3; and in '98, two of $3 and two of $5. In '99 the company paid the largest dividends in its history, consisting of one of $5, one of $6, one of $10 and one of $15. Feb. 20, 1900, a dividend of $8 was paid. Altogether the company has paid $15,725,000 in dividends.

LEWIS AND CLARKE COUNTY.

C. W. Whitley, Mgr. American Smelting Co.'s smelters and concentrators, East Helena, says he will build a roaster, building and furnaces, including a new stack, to cost $100,000. The present capacity of the plant is 750 tons per day, and over 50,000 tons of ore are at present on the dumps awaiting treatment. The roasting capacity of the plant will be thus doubled.

MADISON COUNTY.

J. H. Conrad says the Madisonian mine, Norris, is sold to L. Z. Leiter of Chicago. The price is understood to be over $200,000. T. L. Trerise will be manager.

SILVER BOW COUNTY.

The Homestake mine in Park canyon, near Butte, has been bought by the Montana Ore Purchasing Co. for $100,000. There is a large body of low-grade copper ore, averaging about 6% in copper and ten ounces in silver.

NEVADA.

LINCOLN COUNTY.

(Special Correspondence).—Eagle Valley Mining District: The writer left the present terminus of the Oregon Short Line at Milford, Beaver county, Utah, boarding the train of the Utah & Pacific, which runs from Milford to Uvada, a distance of seventy-five miles over a level stretch of plain, lying between parallel mountain ranges. The latter road was completed last year under the direction of the president, A. W. McCune, of Salt Lake City. At Lund station, stages and freight teams go to Cedar City, while Modina is the shipping and staging point for St. George, Utah, and Grand Gulch, Arizona. Uvada is the present terminus of the road and is located on the line between Utah and Nevada; and is the shipping point for Stateline, Utah, and Deer Lodge, Pioche, Panaca, De Lamar and other points in Lincoln county, Nevada. Deer Lodge is seventeen miles northwesterly from Uvada and is the new town containing the records of Eagle Valley mining district, organized in December, 1895. About 300 locations have been recorded. The district embraces an area about four by fifteen miles, extending along the western slope of a mountain range trending northward and southward, the boundary line of Utah and Nevada being near the crest of the range. The altitude of Deer Lodge is about 6700 feet, being located in a ravine where there are wells of excellent water. The smooth, oval-shaped hills and ridges which characterize the surface generally are covered by a thick growth of scrubby cedar and pine timber, which is serviceable for fuel, the construction of cabins, etc.

The country rock is porphyry and the hills have been worn down by the erosions of nature, leaving exposed outcroppings of the most distinct character. The ledges thus exposed, on being exploited, are shown to be between well-defined walls, the gangue rock being composed of quartz, feldspar, talc and decomposed material. The quartz, spar and talc carry free gold, even at the surface, considerable of which is visible to the unaided eye, though the minuteness of the gold particles as a rule place them beyond the reach of the ordinary amalgamating method. Present exploitation and development indicate that the bulk of the ores run from $6 to $20 gold, though there are various streaks which run higher. The ores are highly siliceous, containing very little of the pyritic bases or sulphides, and so far as tests have gone they are considered well suited to cyanide and chlorination processes. The work on the average claim does not go deeper than 20 to 50 feet, though there are three shafts in the district which sink from 180 to 220 feet and several tunnels which cut ledges at considerable depth.

The outcropping veins exposed are numerous and parallel each other, and in many cases an outcrop is traceable from hill to hill.

The most important operations of the district are those of the Horseshoe G. M. Co., at the head of which is A. W. McCune, above mentioned in connection with the Utah & Pacific railroad. This company have a large area of ground in a body, including several groups of mining claims. Their headquarters are at Fay, a new town one and one-half miles from Deer Lodge, and where their office, store, boarding house and cottages are already built. A pipe line, four miles long, connects Fay with springs of water at a higher altitude and the supply thus afforded is ample and of good quality. The Homestake group of this company has a 180-foot two-compartment shaft, from which crosscuts are being run to the ledge, which outcrops at a higher point. A steam hoist and compressor are set up here and air drills will be used as soon as possible. At the Horseshoe group two shafts have been sunk about 200 feet each, by whim work, on the vein, with drifts in opposite directions at the 100 and 200-foot levels. The work here has been sufficient, it is deemed, to demonstrate the character and value of the ore and, to a large degree, the extent of it. On the same group machinery for hoisting and air compression are to be put in. In the same locality, along the water line, a 100-ton cyanide reduction plant is being erected, the material for the building and equipment being partly on the ground. The operating features will consist of crushers, coarse and fine rolls, elevators, screens, driers, leaching and solution tanks, precipitation apparatus and suitable steam power plant. The plans provide for a skip to carry the ore from the mine shaft to a point up the gallows frame, thence to crushers. The work and equipment of this company are of a thorough and substantial character and their success will doubtless be a demonstration of value to other properties in the district. It is understood the Horseshoe Co. have bonds on other claims in the district and that they are developing some claims in Pike's diggings, four miles southeast of Deer Lodge.

Joining the Horseshoe holdings on the west is the group of thirteen claims known as the Indiana, belonging to H. L. Pickett and associates. The grounds covered by this group have four or five outcropping ledges, on each of which is considerable development which shows values ranging from $6 to $10 near the surface.

The Gold Bug group, northwest of Deer Lodge, belongs to Hammond, Lytle, Moody and others, and is developed by a 300-foot tunnel on the vein, on which it is considered there is an excellent showing. The ores here carry some silver as well as gold. Here, as elsewhere, the float will horn free gold. The ledge, where opened, is of good width.

The Interocean group, located by Bennett, Ross and others, one mile west of Deer Lodge, is also typical of the district, so far as indications go, and has some development.

The Ross group is provided with buildings and has several hundred feet of development work done, some ore shipments from which have been made.

The Mohawk group of four claims joins the Horseshoe on the north and the Homestake on the south and belongs to John Ryson of Deer Lodge, who has bonded it to D. A. McDonald of California.

The Fawn, belonging to Daniel Ross and others, comprising three claims, recently made a strike of free gold in white quartz and silver in hematite of iron, which ran well. This was found within a few feet of the surface.

The first cabin in Deer Lodge was built by W. T. Troutman, who was among the first to make location of mining claims.

Judge Henry Rives of Salt Lake City, John Ryson and C. Lytle of Deer Lodge, are promoting a water system which will be of value to this and the Stateline district. They have secured a group of eight springs in the mountains, near the boundary line, capable of supplying a large volume of water for domestic or other purposes. A conduit will be made to tap all these springs to a common reservoir. The water may then be piped to Deer Lodge, Stateline or to any mine or mill requiring it. The Stateline mining district is six to seven miles east of Deer Lodge, on the opposite side of the mountain range. WASCOTT.

Deer Lodge, March 3.

The Clementina mine, near Good Springs, has been bonded for $50,000.

Mgr. Marx of the Ely M. Co., at Ely, has definitely decided to build a new mill.

NEW MEXICO.

GRANT COUNTY.

It is locally reported that the smelter at Silver City has been sold to the smelter trust and will be shut down. The El Paso smelter output would then be increased from 1000 tons to 1500 tons per day, and the cost of treating the ore from $1.50 to $2 a day.

SANTA FE COUNTY.

The smelter at Cerrillos started on the 13th. The Hardscrabble mine at Magdalena has commenced shipping the 15,000 tons of ore on its dump thereto. There are 400 tons of dry ore at the smelter, the rest being wet ore. The fluxing iron for the dry ore is being shipped from Glorieta.

OREGON.

BAKER COUNTY.

The Ibex mine, near Sumpter, has not been sold to S. W. Ray of Port Arthur, Canada, but has reverted to its original owners. The first payment was made in December, Mr. Ray assuming charge of the property. When the second payment was due, he failed to respond.

The Gem mine, near Sparta, has been sold to Portland men for $10,500.

JACKSON COUNTY.

(Special Correspondence). — Thirty-five

miles north of Medford the Lower Elk Creek mining district is an undeveloped and nearly unprospected region, with plenty red fir timber, good streams and fine climate; country rock, andesite; cutting this are numerous parallel dykes of felsite, in width 5 to 200 feet. These white dykes are well mineralized, a fine-grained variety of iron pyrites being generally disseminated through them, in places concentrating into considerable bodies of irregular shape of a nearly pure sulphuret ore. This carries a little gold, $4 to $6 per ton, but no appreciable quantities of copper or lead.

In a portion of the district a number of the felsite dykes are accompanied by a system of well-defined quartz veins. Some of them possess gouges, polished faces, slickensides, ribbon structure and other evidences of true fissure veins along which more or less faulting has occurred. The ore in these veins is galena and chalcopyrite, carrying a good value in both gold and silver. Although highly refractory, requiring concentration and smelting, two properties have opened up bodies of ore—the Collie Dog and the Bright & Sparkling, adjoining mines on the same vein.

There is one thing of great importance which has to be taken into account in prospecting this district: the ore lies low and shafts have to be sunk to reach it. The amount of chalcopyrite and galena in the veins increases from higher to lower levels, i. e., from the original surface down, until a level is reached on which they are in sufficient quantities to constitute it what may be called the mineral zone—the zone where deposition of copper, lead, gold and silver was most active. Unlike the pyrites disseminated through the felsite dykes, the galena and chalcopyrite in the quartz veins were not derived by lateral secretion from the country rock, but were introduced from below at a great depth and brought up in solution in hot, alkaline waters. Deposition occurred all along the vein, but as the surface was approached it greatly decreased.

The rocks being of early Tertiary age, much newer than the mineral-bearing formations of California, erosion has not cut so deeply into them and the mineral zone is barely exposed in the deeper gulches. The district differs decidedly from any California district, belonging rather to the class of Colorado and Montana deposits. About fifty miles north on this same belt is the Bohemia district, now coming into prominence. So far as I can learn, its geological conditions are similar to this.

Medford, March 10.

SOUTH DAKOTA.

(Special Correspondence).—At the annual meeting of the Detroit & Deadwood G. M. Co. at Detroit, on the 5th inst., the company's name was changed to Detroit & Deadwood M. Co., the scope, purposes and objects of the corporation materially enlarged and the capital stock reduced from $2,000,000 to $1,000,000. The erection of a chemical reduction plant was decided upon.

Detroit, Mich., March 8.

UTAH.

IRON COUNTY.

(Special Correspondence). — Stateline District: Crossing the range from Deer Lodge, Lincoln Co., Nevada, into Iron Co., Utah, the town of Stateline is soon reached. It is favorably located on a level site, near the foot of the mountains, along a ravine where wells of water are obtained. The road from Deer Lodge to Stateline follows along the old Pioche stage line which was so well traveled from '70 to '80. Near the Utah-Nevada boundary line, one and a half miles west of Stateline, Government peak rises to an elevation of about 10,000 feet, on the summit of which a Government signal station was maintained in earlier days. The hills on the east side of the boundary range are higher and the formation more broken than is the case on the Deer Lodge side, but the growth of scrubby timber is about the same. The veins or ledges here trend northerly and southerly as a general thing, though there are one or two well-explored ledges that cut the general formation at right angles. In the north and south veins the gold predominates, but in those trending east and west the most important values are silver.

The country rock of the district consists of porphyry and bird's-eye trachyte. The ledges are usually of good width, though both walls are not always readily found. The gangue rock comprises a hard, tough quartz with streaks of spar and fluorspar, in all of which are gold and silver. The gold in various mines appears to be largely in the free state, though in others it is found in sulphurets. The silver exists in chlorides (horn silver), sulphurets and some in the form of ruby or antimonial silver.

The Johnny mine, which perhaps has attracted more interest than any other property in Stateline district, belongs to the Johnny G. M. & M. Co., of which W. J. Dooly, C. O. Newell, F. M. Wilson, J. J. Brown and Mrs. E. Newell are principal stockholders. The group comprises several claims on the eastern slope of the hill, the development on which consists of a shaft 100 feet deep, with considerable drifting in ore in opposite directions at the 50-foot and 100-foot levels. A short time ago a shipment of twenty-six tons of ore was made to a Salt Lake smelter that brought $5259; also, seventy-five tons from the same shaft were milled at the company's Tremain stamp mill, from which a saving of $1117 was made, and the tailings therefrom, according to tests made, average $12 per ton. In the ore house are ten tons of sorted ore that will average over $500 to the ton, and it is estimated they have 500 tons of marketable ore on the dump. The principal values here are gold, which at present depth is quite free, silver values being in chlorides and native silver. There are, however, some silver and gold in sulphurets and manganese. The ledge of the Johnny trends north and south, but the walls are not reached by present work.

The Ophir is located a mile north of the Johnny and at about 600 feet higher elevation. It was located in 1896 and the ores taken out have practically paid for all development and improvements. An incline shaft sinks 265 feet, following the dip of the vein. Drifts have been run in both directions on the vein at the 45, 100, 150, 200 and 250-foot stations. The vein runs nearly east and west and has a width of from 6 to 10 feet, the material from wall to wall being well mineralized. The values, comprising silver and gold, are carried in white and dark quartz and spar and a little manganese. The silver values are said to run from 100 ozs. to 3100 ozs., the gold running from $2 to $60 to the ton. The silver is in chlorides and sulphurets, the latter form including some gold. There is very little free gold in the Ophir. These ores all contain a high percentage of silica—from 85% to 90%. The Ophir group comprises six claims, which were located by M. Sullivan, who located, developed and sold the Harqua Hala group in Arizona. The Ophir now belongs to Lynch, Lathrop & Effinger. A shipment of forty tons of ore was made which averaged $250 per ton.

The Creole is developed by a 400-foot tunnel, a 40-foot winze, 100 feet of drifting—all on the vein. The ore is a gold-bearing quartz, carrying approximately $14 gold, $3 silver and 90% silica, with some manganese. This belongs to J. J. Knight, McBurney & McDonald.

The Utah Spur, belonging to J. J. Knight, has been exploited some, showing good silver values in a vein structure similar to that of the Ophir.

The Aggie D. is under bond to John Erickson and George Rice, who have a 100-foot shaft and 100 feet of drifting on a vein which is said to be 30 feet wide, in which ores assayed over $18 per ton.

Samples from the June Bug group of five claims ran from $2.40 to $8.60 gold and from 44 ozs. to 87 ozs. silver. The Blackbird, near the Creole, has a 48-foot shaft, the drillings from the work assaying $30 gold and 5 ozs. silver. The Silver Dick, near the Ophir, is also said to make a showing of about 83 ozs. silver and $16 gold. J. C. Muldoon is largely interested in the above various claims.

A. G. Bast and associates of Salt Lake City have a large number of locations in the district on which considerable work has been done, with results that average up with the typical prospects of the camp. There are many locations here on which good indications exist; those mentioned more or less definitely are believed to be a fair illustration of the characteristics of the district. WASCOTT.

Stateline, March 5.

SUMMIT COUNTY.

The Silver King, at Park City, will build an aerial tramway and put in five tanks 60x4 feet.

FOREIGN.

AUSTRALIA.

From Kalgoorlie is reported the almost utter failure of all the enormously expensive sulphide roasting plants erected by the Associated, Lake View Consols and Boulder Main Reef Companies.

BRITISH COLUMBIA.

Rawhiding the ore from the Slocan mines is said to be at a standstill because of a shortage of hides.

MEXICO.

The Esperanza M. Co.'s new mill at El Oro will start up April 1st.

T. L. Davenport has charge of the Candelaria M. Co., at San Pedro, Chihuahua. The company employs 800 men. Its smelter is at Juarez, its reduction works at Chihuahua. The ore carries considerable silver, gold and copper.

Personal.

JAS. D. HAGUE is in Grass Valley, Cal.

GEORGE JOHNSTON has returned to San Francisco from Baker City, Or.

HORACE F. BROWN of Chicago is examining mining property at Sumpter, Or.

CHAS. D. LANE is in San Francisco from Cape Nome, whither he returns in May.

E. ROHLFING, Telluride, Colo., has been appointed Mgr. Red Wing mine, Bingham, Utah.

W. A. PAINE, Pres. Helvetia Mining Co., is visiting the property at Helvetia, Arizona.

CHAS. BUTTERS is operating two mines in San Salvador, but expects to be in San Francisco about June 1st.

GEO. E. BATEMAN, whilom Supt. Black Spider mine, Keswick, Cal., is operating at Big Canyon, El Dorado county, Cal.

CAPT. ARMSTRONG, Mgr. Turner mine, at Sitka, Alaska, is in San Francisco purchasing machinery for his property.

J. T. MCKENNA has returned from Peru and assumed charge of the concentrating mill of the Iron Silver M. Co., Leadville, Colo.

J. HOHISEL, nine years in charge of the Smuggler concentrator, Telluride, Colo., is now Supt. Stark Milling Co., Aspen, Colo.

PRES. LOUIS AUERBACH and Sec. A. N. Winslow of the Boston & Tuolumne G. M. Co. are visiting their mining property in Tuolumne county, Cal.

A. P. FLAGLER of New York, locally supposed to represent capitalists headed by J. D. Rockefeller, is examining the Maryland mine, Grass Valley, Cal.

JNO. W. DIXON has returned to Leadville, Colo., from an inspection of California mill practise, and is about to build a mill for his Little Joe mine, Leadville, Colo.

J. C. WIGGINTON, late Auditor Bimetallic Smelter, Leadville, Colo. now goes as general auditor Woods Investment Co., Victor, Colo. Chas. Hussey succeeds Mr. W. in the Leadville office.

FRED ZEITLER of Nevada county, Cal., Vice-Pres. California State Miners' Association, is in San Francisco and in the absence of Pres. W. C. Ralston, now in Washington, D. C., will occupy the chair at the meeting to-night of the executive committee of the association.

E. H. BENJAMIN, secretary California State Miners' Association, is back in San Francisco from a long and perilous trip to Ungas island, Alaska. On his return the steamer Wolcott, on which he was a passenger, was wrecked and is a total loss in Shelikoff straits, Mr. Benjamin barely escaping with his life to a glacier, from which, with his fellow passengers, after sixty hours' exposure, he got to Uyak, where he remained twenty-four days before rescue by the steamer Excelsior, which brought him to Seattle.

Catalogues Received.

Wood's propeller pump is thoroughly illustrated by sectional drawings and half-tone engravings in a 50-page booklet issued by the general agent, L. G. Harrison, 31 Main St., San Francisco, who will send it upon request anywhere.

"Compressed Air Pumping," catalogue No. 6, of the Rix Engineering & Supply Co., 519 Howard St., San Francisco; half-tone engravings and sectional drawings of air-lift pumps and general treatise on pumping by means of compressed air.

No. 46 of the Fraser & Chalmers series, treating of Riedler air and gas compressors and blowing engines; 140 pages of illustrated description of everything in connection therewith and some technical discussion thereof; a handy volume for any one interested; sent by Fraser & Chalmers, Twelfth and Washtenaw Ave., Chicago.

Coal washing equipments, retarding conveyors, steam coal tipple, elevating-conveying machinery, coal mining machinery, described and illustrated in detail in the usual thorough style of the Jeffrey Mfg. Co., Columbus, Ohio, whose Western office is at 412 Seventeenth St., Denver, Colo.; Eastern office, 41 Dey St., New York City.

"Hydrocarbon Burners, Blow Pipes, Furnaces and Cupel Machines for Chemists and Assayers" is the title of a handy-shaped catalogue or trade treatise issued by the progressive firm of F. W. Braun & Co., 501–505 North Main St., Los Angeles, Cal. The illustrations in this catalogue are above the average; they correctly portray the various devices described and add to the volume's value in the hands of an assayer or chemist. The descriptions of the apparatus are brief, but clear, and are accompanied by easily understood directions for mounting and operating. A specialty is made of hydrocarbon blow-pipe outfits and hydrocarbon burners, the latter claimed to be "the only perfect burner for liquid fuel." These people make an automatic cupel machine, recently illustrated and described in these columns at considerable length, which deserves attention. They are also wholesale suppliers of cyanide of potassium, 98–99%, and will send their handsome descriptive catalogue upon request.

Commercial Paragraphs.

THE Southern Pacific Ry. Co. is installing another 7½ Gates breaker for making ballast. The Gates Iron Works breakers are now in operation on eighty-two railway systems.

THE Navy Department has placed an order with the New York Air Compressor Co., 120 Liberty St., New York, for two duplex compound air compressors of large capacity for the Charlestown Navy Yard, Boston, Mass.

THE Lehigh Valley Coal Co. put in a Cross oil filter on trial about one month ago. They have just ordered nine more. The Burt Mfg. Co. of Akron, Ohio, manufacturers of the Cross filter, say they are breaking all records on business so far this year.

IN the issue of Feb. 24th was mentioned that Jas. Detrick of San Francisco was about to compete with Siberian camel trains and establish a more modern system of freight transportation. This week he has sent two traction engines and eight steel cars to Reval, Eastern Siberia, via New York, Paris and St. Petersburg. Each traction engine is 50 H. P., each car or wagon has a capacity of twelve tons. The trains will be used to freight supplies to the American miners in that section. The traction engines, steel cars and every requisite connected therewith were manufactured by the Daniel Best Manufacturing Co., San Leandro, Cal., who supply all parts of the world with traction engines of a style and economic value that render them of profitable use. With this shipment to Siberia goes one of the Best Mfg. Co.'s machinists to set up and start the train in successful operation.

THE Denver Engineering Works Co., Denver, Colo., have in process of construction two silver-lead furnaces, 45 by 140 inches, for the Germania and Mingo plants of the A. S. & R. Co., at Salt Lake; three of their Standard cold blast matte furnaces, 40 by 176 inches, for the Bingham Copper & Gold M. Co., of Salt Lake; two 25 H. P. electric hoists for the Boston & Montana C. C. & S. Co., of Great Falls, Montana; two 5 H. P. electric hoists for the General Electric Co., of Denver; twelve electric hoists for the Colorado Electric Power Co., at Cripple Creek; the entire crushing machinery for the Globe plant of the A. S. & R. Co., at Denver. They have recently shipped two carloads of sheet-iron hopper work to Taylor & Brunton's new oxide plant at Pallas, Utah; six carloads of high pressure horizontal tubular boilers to the Cochiti G. M. Co., of New Mexico; one of their improved timber framing machines to the Ibex M. Co., Leadville, Colo., and one to the British Columbia Corporation, at Rossland, B. C. They have also shipped four carloads, to British Columbia, comprising two 150 H. P. double drum electric hoists. The third 150 H. P. electric hoist is now complete and ready to ship.

THE Parke & Lacy Co., 21–23 Fremont St., San Francisco, Cal., writing to the San Francisco Chronicle, say: "Referring to the following—'A Kansas City firm recently built and shipped a 30 H. P. gas engine to the Norwegian Copper Works on the island of Trumso, which is on the northern coast of Norway, near the 71st parallel, and almost as far north as the most northern part of Alaska'—which appeared under the heading 'Progress in the Industries' in your issue of March 12th, it has occurred to us that it might be interesting to your readers to know that the gas engine referred to formed a part of a plant sold by our company through our London office, the orders for which were placed through our office here. The plant consisted of a 42″ copper smelting plant complete, included in which was the 30 H. P. gas engine referred to in the article, which was supplied by the Weber Gas & Gasoline Engine Co. of Kansas City. The balance of the plant was supplied by various houses in this country and the whole accumulated at New York and sent forward via London to Norway."

Obituary.

WALTER PRICE, cyanide expert for the Golden Horseshoe mine, Western Australia, died recently from cyanide poisoning, through inhaling the fumes.

A. C. RAND, president of the Rand Drilling Co., New York, and treasurer of the Laflin & Rand Powder Co., died in New York City on the 11th inst., aged 59 years.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR WEEK ENDING MARCH 6, 1900.

644,843.—MOTOR VEHICLE — A. Bink, Stockton, Cal.

644,723.—LIFE BOAT—W. S. Ray, S. F.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ELASTIC TREAD HORSESHOE.—C. Y. DeLay, Murphy, Cal. No. 644,284. Dated Feb. 27, 1900. This invention relates to an attachment for metallic shoes by which an elastic bearing is provided for the horse's foot, and a means for removably securing the same. It comprises a tongue and grooved bar of rubber, and a correspondingly channelled metallic shoe so constructed that the elastic bar may be introduced or removed in such a manner that it is practically locked in place for use. The rubber bar is slipped into the groove or channel in the lower part of the shoe and pushed around a curve of the shoe, so that the outer face or tread covers the flanges of the shoe, and provides a perfect rubber tread. The shoes themselves are provided with nail holes so disposed that they can easily be fastened upon the animal's foot.

CONCENTRATOR.—George Gates, Jackson, Cal. No. 644,289. Dated Feb. 27, 1900. This invention relates to improvements in endless traveling belt concentrators, in which the belt passes over drums at opposite ends of the frame, so that its upper surface stands at an incline from one drum to the other, with means by which the belt is caused to move slowly from the lower toward the upper end, having devices by which the pulp mixed with water is delivered upon the belt so that with the movement and travel of the belt and the action of the water, the lighter valueless portions are washed off over the lower end, and the heavier material will be gradually concentrated and carried up over the upper end of the belt and delivered into a wash and collecting tank. A trough is arranged transversely above the belt for distributing the pulp and water which is received into it by means of divergent channels and these delivered into a series of parallel troughs extending transversely above the belt, and so arranged that pulp will overflow from one trough to the next. These troughs are perforated with holes through which the pulp will fall upon the belt at different points in the length thereof, depending on the gravity of the pulp which is being fed.

LOCK.—J. C. Meyer, San Francisco, Cal. No. 644,255. Dated Feb. 27, 1900. This invention relates to improvements in door locks, and is designed to provide an improved means for operating the latch by which the door is held in a closed position. In this lock there is a slidable spring-pressed latching bolt having rearwardly extending parallel bars, a frame fixed between said bars and toggle levers having the front ends pivoted to the stationary frame. A pin projects through slots in the rear portion of the frame and connects with the parallel bars of the slidable latch. The transverse angles of the toggle levers are united by pivots so that they project through the lock plate, and hollow knob shanks are fixed upon opposite sides of the door in line with the projecting lever angles. Spring-pressed push buttons are slidable in the outer ends of the knob shanks and pins projecting with said buttons extend inwardly through guiding tubes so as to contact with the transverse angles of the toggle levers, so that pressure upon the push buttons acts to compress the levers transversely and extend them in line of movement of the latch and thus withdraw the latch. When the buttons are released the latch will be returned to its normal position by any suitable spring.

NAILS.—J. T. Eyster, Eagleville, Cal. No. 644,286. Dated Feb. 27, 1900. This invention is designed to improve nails for fastening timber and other articles together, and its object is to provide a means for securely locking nails of all descriptions when they have been driven—such a formation of the entering point as will insure the cutting of the fibres of the wood to form a channel into which the spiral of the nail passes, and to lessen the danger of splitting the wood by the driving of such a nail. The upper part of the

shank of the nail is cylindrical, the lower part is flattened and twisted into a spiral form as shown in the accompanying cut. The front edge of the spiral is beveled to an edge, while the rear is square without bevel to give increased strength at that point. The nail has a rounded point, the edges of which are beveled, one of the edges merging into the beveled front edge of the spiral body and forming a continuation thereof. This construction causes the nail to turn about its axis as it is driven, and when once seated it is firmly held in place, and not liable to be withdrawn.

OIL GAS VALVE AND APPARATUS.—Samuel Guthrie, San Francisco, Cal. No. 644,741. Dated March 6, 1900. This invention relates to an apparatus for continuously feeding oil to the retorts or channels of gas-making apparatus, and a valve by which the feed may be regulated and maintained at a constant flow. It consists of a pipe tapering from and returning to the tank, a pump by which a continuous circulation of liquid within the pipe is produced, and means for regulating the pressure within the pipe, together with valve or cock through which the liquid is delivered under pressure, this valve having a rectangular or diamond-shaped port, and a correspondingly shaped passage over which it is adjustable. There is a by-pass pipe connected with the main pipe upon each side of a cock which controls the flow and regulates the pressure.

Recently Declared Mining Dividends.

Elkton, Colorado, $33,750	March 20
Amazon, Colorado, $30,000	March 15
Silver King, Utah, $75,000	March 10
Portland, Colorado, $60,000	March 15
Swansea, Utah, $5000	March 15

Grand Gulch, Utah, $2400	March 15
Isabella, Colorado, $67,500	March 24

WANTED.

A Rich Placer proposition, adapted to working by Railroad Steam Shovel, or Dry Land Excavator. Description, with price and terms, to receive attention must be accompanied by reliable reports and references.

Address: **EDWARD N. BREITUNG,** MARQUETTE, MICH.

Quicksilver

—FOR SALE BY—

The Eureka Company, OF SAN FRANCISCO.

ROOM 1, - 426 CALIFORNIA STREET, SAN FRANCISCO.

M. S. HAUSER,

Room 39, 3 California St., San Francisco, Cal.

Will act as purchasing agent for mining companies.
Will use the benefit of his wide experience in getting the best articles at the lowest prices, securing low freight rates, and prompt delivery.
Will submit estimates on all kinds of supplies.
Will work for either a small salary or a commission, and show a saving greatly in excess of charges.

Latest Market Reports.

SAN FRANCISCO, March 15, 1900.

SILVER—Per oz., Troy: London, 27⅛d (standard ounce, 925 fine); New York, bar silver, 59¾ cts. (1000 fine); San Francisco, 59⅜; Mexican dollars, 48⅜c.

COPPER.—New York: Lake, 1 to 3 casks, 16.75 cash; carload lots, 16¼; Electrolytic, 1 to 3 casks, 16.50; carload lots, 16.00; Casting, 1 to 3 casks, 16.25; carload lots, 16.00. San Francisco: 17½@18. Mill copper plates, 21½c; bars, 23½@25c.

LEAD.—New York, $4.72; St. Louis, $4.72; San Francisco, $4.88; pipe 7½, sheet 8¾, bar 6½c. London, Soft Spanish Lead, £16 15s=4.82c per lb.

SPELTER. — New York, $4.60; St. Louis, $4.60; San Francisco, ton lots, 6c; 100-lb lots, 6¾c.

ANTIMONY. — New York, 9½c; San Francisco, 1000-lb lots, 11c; 300 to 500 lbs., 12@14c; 100-lb lots, 15@18c.

BABBITT METAL.— San Francisco, No. 1, 10c.

SOLDER. — Half-and-half, 100-lb. lots, 22½c; San Francisco, Plumbers', 100-lb. lots, 19c.

IRON. — Pittsburg, American soft—pig—large lots—$25.25; Scotch, $26.50; San Francisco, bar, per lb., 3½c. President Lambert of the American Steel & Wire Co. has a cable from the company's London office confirming the report that the steel and iron mongers of Germany have contracted in England for the entire output of pig iron in Great Britain for the year 1901 at $26@27 a ton. President Lambert says: "This means higher prices for pig iron, of course. I should not be surprised to see Bessemer pig selling at $5 above present prices by the first of April. England has sold a year's output to Germany. That means we will have to supply England's needs. She will buy from 800,000 to 1,000,000 tons from America to meet the deficiency."

STEEL.—San Francisco, bar, 12c to 20c per lb.

QUICKSILVER. — New York, $51.50; London, £9 15s; San Francisco, local, $51.50 ℔ flask of 76½ lbs.; export, $47.50.

SITUATIONS WANTED.

By a Practical Miner who is thorough and up to date in working a mine. Can handle men to advantage. Understands milling, concentrating and the erection of all kinds of mining and milling machinery. With some years of experience. Will accept a position to manage a mine or mill. First-class testimonials furnished as to abilities, integrity, etc. Address QUARTZ, care Mining and Scientific Press.

MEXICO.—A thorough, all-round mining and mill man wants position in charge of mill or mine. Many years' experience in Spanish countries, language and laws Very best of references. Address H. C. T., 413-415 Golden Gate Avenue, S. F.

Wanted—A Position as Superintendent in a hydraulic mine by a miner who has had twenty years' experience. Best of references as to ability, honesty and sobriety. Address S. O. G., care of Mining and Scientific Press.

Metallurgist and Chemist, technical graduate, fifteen years' practical experience in Mexico and the United States, familiar with the treatment of gold, silver, copper and lead ores, desires engagement. Address METALLURGIST, this office.

WANTED—By an engineer posted in mining and milling, a position as superintendent or manager. Am prepared to plan, erect and operate economically precious metal mills. Sober, reliable. Address W. G., Mining and Scientific Press.

Mining and Metallurgical ENGINEER

DESIRES POSITION.

Had long experiences in gold and silver mines and reduction plants. Had charge of stamp mills and cyanide plants. Can furnish best of references. Address CYANIDE, care this office.

WANTED.

Wanted—Gasoline Engineer,

One who is a machinist preferred. Applicants state references and salary expected. Address M. M., care of this journal.

WANTED.

A First-Class Diamond Drill Man to Set Bits.

Address THE MOUNTAIN COPPER COMPANY, LTD., Keswick, Shasta Co., Cal.

WANTED.—A Second-Hand White Howell Roaster, also a Revolving Drier.

Must be in good repair. Address ARTHUR HENDEY, Agent, Copper Chief Mining Company, Jerome, Arizona.

Quicksilver

For Sale in Lots to Suit.

REDINGTON & COMPANY, Wholesale Druggists, 23-25-27 Second Street, San Francisco.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from George H. Hedrick, in the Hedrick Gravel Mine, near San Andreas, Calaveras Co., to deposit tailings on a flat below the mine; from Wm. Weyman, in the Weyman Placer Mine, near Placerville, El Dorado Co., to deposit tailings in a reservoir below the mine; from Hugh H. Crain, in the Pigeon Creek Mine, near Plymouth, Amador Co., to deposit tailings in Indian Creek; from Henry Meyer, in the Greenhorn Mine, at Cherokee, Nevada Co., to deposit tailings in Shady Creek; and from the Emery Gold Mining Company, in the Emery Hydraulic Mine, near Mountain Ranch, Calaveras Co., to deposit tailings in Adobe Gulch, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on April 2, 1900, at 1:30 P. M.

INVENTORS, Take Notice!

L. PETERSON, MODEL MAKER,

544A MISSION STREET, bet. First and Second Sts., SAN FRANCISCO. Experimental machinery and all kinds of models. Tin and brasswork. All communications *strictly confidential.*

10 H. P. Gasoline Hoist for Sale.

Complete outfit in good condition. Price low. Address PAUL J. PITNER, Placerville, Cal.

Experienced Mining Engineer (age 40) reports on mines and their economical development; ore dressing; processes; mining machinery and mill construction. References. P. O. Box 971, Denver, Colorado.

FOR SALE.

FOR SALE.—DIVIDEND-PAYING, HYDRAULIC placer. Extensive deposits. Old channel gravel, water, pressure, grade, dump, and gold. Rigid investigation invited. Thoroughly legitimate. Banking references. Owner. IDAHO, care of Mining and Scientific Press.

Mines for Sale.

A specialty made of developed properties in Mexico and the Southwest. Good mines and prospects are wanted. Bona fide correspondence of mine owners, capitalists and investors solicited.

H. B. RUNKLE, Mining Broker, El Paso, Texas.

Group of Gold and Silver Mines for Sale.

For sale on very reasonable terms, or leasing proposals will be entertained, a group of gold and silver mines in the State of Durango, with excellent old records and some good modern machinery. For full particulars apply to MR. A. KEMPSON (Resident Agent), care of Mr. Stalocknecht, Durango, Mexico.

A BARGAIN.

3500 feet of 16-inch, 5 B. W. G. National Tube Works seamless pipe. Kimberly joints. Immediate delivery.

Address P I P I, Room No. 140, No. 32 Broadway, New York City.

STEEL RAILS FOR SALE.

400 Tons 40-lb Relaying T Rails with Plates. One 30-Ton Saddle Tank Standard Gauge Locomotive, f. o. b. San Diego, Redondo, or San Pedro, Cal. Correspondence solicited.

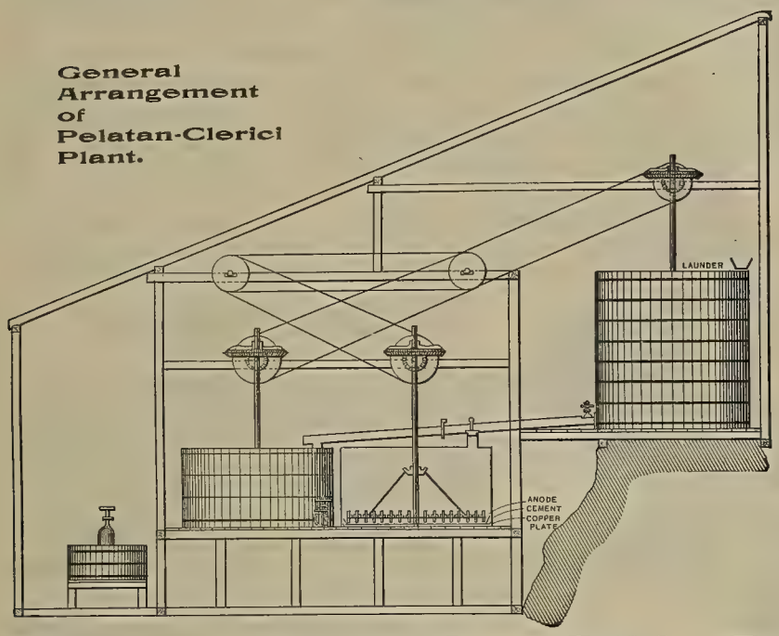
Works at South Chicago. CHICAGO, ILL., U. S. A.

SMOOTH-ON CASTINGS.



An iron cement in powdered form, for repairing leaks or fractures in steam or hydraulic work, applied by mixing with water; hardens quickly and expands in hardening. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

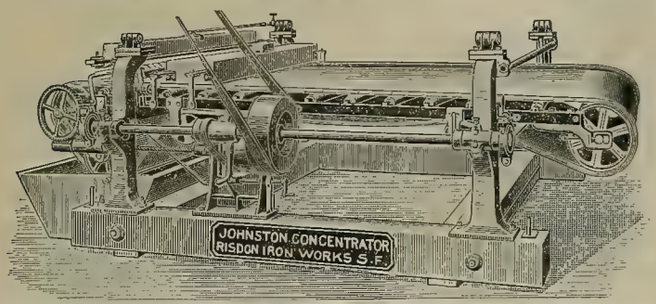
THE "PELATAN-CLERICI" PROCESS

OF TREATING REFRACTORY ORES

General Arrangement of Pelatan-Clerici Plant.

Saves the precious metals by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process from raw material at less cost. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge. Several mills saving over 90 per cent of values by bullion returns. Simplicity. Economy. Efficiency.



FOR PARTICULARS, WRITE TO

THE RISDON IRON WORKS,

SAN FRANCISCO, CAL.

AGENTS.

The JOHNSTON CONCENTRATOR.

DURABILITY, CAPACITY AND SIMPLICITY ARE ITS ESSENTIAL POINTS.

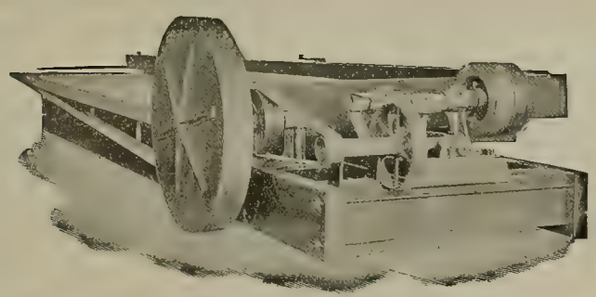
SAVES MORE VERY FINE SULPHURETS THAN ANY OTHER CONCENTRATOR MADE.

The Johnston Concentrator is slung with arms from above on an angle, giving it the oscillating motion that makes it a perfect machine. This undulating motion immediately settles the sulphurets, retaining all amalgam, leaving sulphurets very clean, one 6-ft. Johnston doing the work of two 4-ft. belt machines.

Send for Catalog No. 14.

Risdon Iron Works,

HOWARD AND BEALE STS., SAN FRANCISCO, CAL., U. S. A.



WHITE, ROGERS & CO.,

Contracting Engineers and Millwrights,

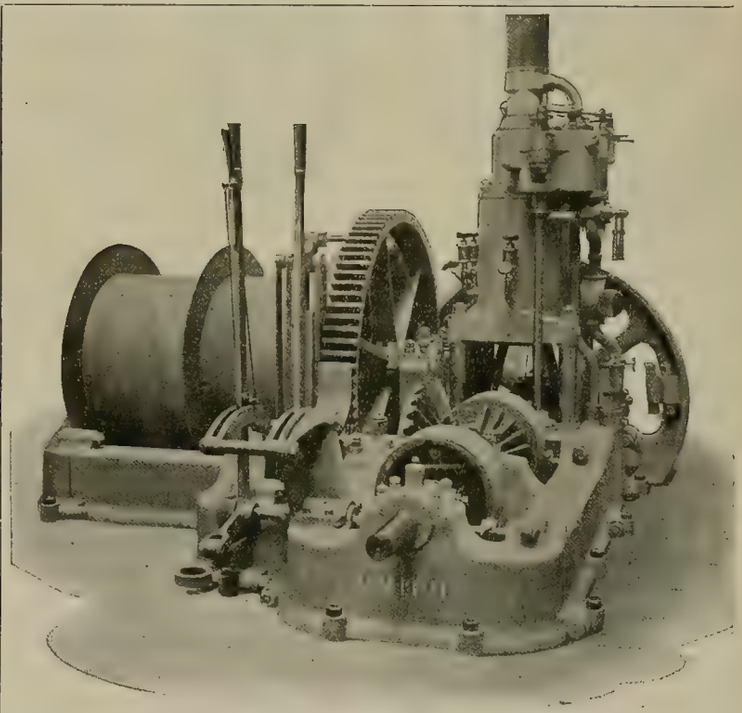
OFFICES, 306 PINE STREET, - - SAN FRANCISCO, CAL.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.



One of these machines will take the place of two or three belt concentrators of any style and do very much better work. Easy adjustment. Little wear.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

—— SEND FOR CIRCULARS. ——

These Machines are Kept in Stock Ready for Immediate Shipment.

The above illustrates the "Union" 25 H. P. double cylinder divided drum mining hoist for double compartment shaft. Cages and cars balance each other, therefore power is only used to raise ore; cost of hoisting ore is therefore reduced to the minimum. Made in sections for mountain transportation.

TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

Office, 314 Howard Street, San Francisco, Cal.

THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

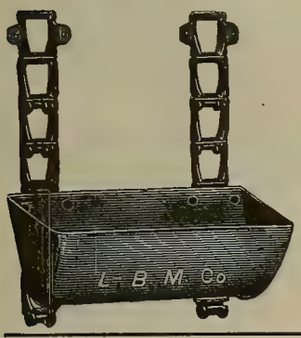
THE IDEAL CONVEYOR BELT



Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

GATES IRON WORKS.

THE TREMAIN STEAM STAMP MILL

has made many fortunes for its owners. It costs but little money. Can be transported anywhere.

CHICAGO, ILLS., Jan. 18th, 1900.

GATES IRON WORKS, CHICAGO, ILLS.

MY DEAR SIRS:—

Replying to your letter of the 17th inst., asking what we have done with the Tremain Mill at the Storm Cloud Gold Mines near Prescott, Arizona, in the past year, will say that we have been unable to run the Mill more than three days out of the week, owing to the fact that we have had, during the past year, but little rain. We were obliged to use settling tanks and save what little water we had, in order to run three days per week. The Mill has worked splendidly—in fact, it is a perfect little giant to do business with, where you have plenty of water for amalgamating purposes.

Enclosed I hand you a statement amounting to $20,210.72, which is the total product of the Mill for the twelve months, giving dates that we sent the bars to the mint at San Francisco and the amount we received for each bar.

I think the Tremain Mill is the best friend that a prospector or an individual who has practically a good mine can get hold of, to furnish him money to develop his property. I bought the Storm Cloud Gold Mines the last of June in 1897. In the fall of that year I bought, as you know, one of your Tremain Mills. From the day I started it it has paid all my developing expenses, and from the report made by the geologist of Arizona, December last, I now have $940,000 of ore blocked out, the expense of which has been paid from the net proceeds of the Tremain Mill. I have paid for over 1800 feet of development work with this Mill since I erected it two years ago last October. My experience teaches me that if anyone has any trouble with the Tremain Mill it is the fault of the man who operates it.

Yours very truly,

WHITING G. PRESS.

ASSESSMENT NOTICES.

CONSOLIDATED CALIFORNIA AND VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of March, 1900, an assessment (No. 15) of twenty cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room No. 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of April, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 1st day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room No. 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

DELINQUENT SALE NOTICE.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, 217 Sacramento street, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 22) levied on the 25th day of January, 1900, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
P. A. Wagner, Trustee	90	980	29 40

P&B BUILDING PAPER

The walls of a house are built for protection. If the sun and weather open up the sheathing, the rain or the air will get in and cause discomfort and doctor's bills. To prevent this the architect or builder uses building paper. There are many kinds, but only two classes—the poor and the good. P & B PAPER is good—the best. It is very strong, odorless, waterproof and airproof, and will not rot. Ask your dealer for samples, or write us for them. We are the makers.

AND PACIFIC ELECTRICAL REVIEW.

No. 2072.—VOLUME LXXX. Number 12. SAN FRANCISCO, SATURDAY, MARCH 24, 1900. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Good Chances for Mining Investment.

As a legitimate business mining has the peculiarity of affording better present opportunities than ever before. It is this that now distinguishes mining from any other business. In nearly every line, competition, trusts and other forms of trade conditions do not tend to make greater the probability of profitable investment of capital, great or small. But in the mining business closer study of ores has made possible the profitable treatment of much that was formerly rejected, and modern methods successfully develop good properties in districts once thought to be worked out. No matter how thoroughly a country may appear to have once been prospected or developed, it is now desirable for present exploitation. Some of the best strikes are being made in old camps, and no miner or prospector is perforce compelled to go to new or almost inaccessible regions to find a good mine. Intelligent development is the present main requirement.

Some Deserved Criticism.

There is a publication at Colorado Springs, Colo.—The Mining Investor—devoted mostly to investors and speculators, that seems to have sufficient understanding to note the misleading speciousness of some mining prospectuses and sufficient nerve to correctly comment thereon. To the unheeding or unknowing reader, some of the statements in some mining prospectuses seem to say a good deal honestly favorable to the mining schemes of which they treat; while, in reality, what is said may be a cunningly contrived collection of words with the appearance of candor or intent to furnish information, but actually misleading or couched in phrases intended to be misunderstood. In the current issue of the Mining Investor, a prospectus of a property in Ward, Boulder Co., Colo., is analyzed. This prospectus—of the Timberline Mines Company—is no better nor worse than dozens of similar propositions, but the same standard of criticism that the Investor measures it by is applicable to that general class. The prospectus discussed is taken up piece by piece, and its entire lack of exactness is shown: its accuracy is disputed, its ambiguity pointed out, its evasion made manifest, and, in general, the untrustworthiness of its statements clearly demonstrated.

"In the Dew Drop mine alone millions of ore are already blocked out. The work of opening the Adit, the Ni Wot and Columbia is going forward every day. A year will see this work so far completed that other millions will be in sight." What are these "millions of ore" and these "other millions." Is this a trick or insufficient explanation? Millions of what? Millions of atoms, millions of tons of country rock, millions of tons of ore, or millions of dollars' worth of gold? The last, I presume, is what we are supposed to take it for, but why not say so? We might take it for millions of dollars now and then be called fools for doing so later on, because it did not actually say so. * * * What has been going on all these years that the Big Five companies have been operating? We are told that 10,000 tons of ore have been treated in the mill. What has been the result? Has it been good? Is it reasonable to suppose that Mr. Merrill would have forgotten to say anything about it if success had been attained? * * *

I object to an illustration such as is contained on the second page, which is supposed to be a section of the mountain with the Adit tunnel running through it. From the tunnel level to the surface, a distance of about 2000 feet, the illustration is marked "ore, ore;" it is colored in gold and the illustration is labeled "A Wedge of Gold." This, surely, is of a misleading nature, as also are the figures showing the possible millions of tons of ore in sight, although the whole thing is cleverly handled in a way that Mr. Merrill might shield himself by saying "I never said so."

That is just the point. The Eastern clerks, tailors, domestics, teachers, clergymen, etc., who read such meretricious prospectuses don't know anything about those things; they read unwittingly, and think it certainly must be good, it sounds all right; and so buy stock. Any one knowing anything of mining would only laugh at such absurd generalities, that really say nothing, but imply a good deal; and yet the prospectus in its entirety may assert (where it it does positively assert) nothing that is not true or capable of demonstration. Any mining man or experienced investor reading the prospectus in question would see that all it really said was "buy this stock; you can't lose much and may win something:" but it is in the covering up of this in glittering language and twisting the facts to make things appear what they are not that the fault lies.

The article referred to contains about 2000 words, and in it its author has done some real good to the mining interests of Colorado. In the long run it hurts a section or a State to fool any one—to get money under false pretenses—and there is so much of surpassing merit in legitimate mining enterprises in Colorado that it is well not to constantly allow to pass unchallenged the reckless juggling with truth and confidence that so often appears in mining prospectuses.

A Profitable Investment.

It is gratifyingly customary to get many kindly comments from subscribers and readers of this paper everywhere that mining is carried on, but of late the number increases. Particularly noticeable is the favor with which original articles written by practical men are received. It has long been the province and purpose of this paper, and it continues to be its pleasure and privilege, to weekly publish more original matter of interest to mining men than any other journal published anywhere. While not ignoring the severely scientific or coldly technical requirements of the profession, it is manifestly of value and interest to all to read the practical experience of men who themselves do every day that about which they write. What is more or better expert testimony than the statement of his work, its method and result by the man who is doing that work successfully right along!

Running through the pages of the past few months is noted a number of such articles, technical, exact and accurate in detail, furnished by miners, many of them past grand masters in the art and science of their calling, specially written for this paper, the favorite and recognized medium of exchange for such information among progressive metal miners. The list of titles exemplifies the practical and valuable character of such articles. Among them are noted articles on "Types of Head Frames," "Characteristic Mines of the California Gold Belt," "How Low-Grade Ores Pay," "Gold Precipitation by Zinc Dust," "Selection of a Mill Site," "Metamorphism of Rocks," "Concentration of Auriferous Sulphides in California," "Increasing Mill Capacity," "Charcoal in the Cyanide Process," "Advantages of Sorting Ore," "Methods of Working Cyanide Plants," "Concentration of Ores," "Cyaniding Prior to Amalgamation," "Temperature of Battery Water," "Genesis of Ore Deposits," "Prehistoric Rivers in California," "Mine Surface Sampling," "Copper Tubes and Sheets Direct from Solutions," "Cheap Mining and Milling," "The Emerson Shaft of the Wildman Mine, Sutter Creek, Cal.," "Motive Power for Mines," "Factors of Success in Mining," "California Drift Mining," "Walls of Mineral Veins," "Phenomena Attending the Accumulation of Bitumen," "The Caving System of Mining," "Blasting by Electricity," "Co-operative Milling," "Ore Shoots and Ore Chimneys," "Chemical Features of Gold," "Laccolites and Their Relation to Ore Deposits," "System of Mine Signaling," "Status of Alien Locators of Mineral Lands," "Notes on Ore Dressing," "Construction of an Upraise," "Quicksilver Recovery from Greasy Refuse," "The Switzerland of Colorado," "Bookkeeping for Mines," "Community Telephone Exchanges," "Gas Engines for Power and Pumping," "As to Selling a Mine," "On the Concentration of Ores by the Use of Water," "Dredging for Gold," "The Formation of Coal," "Clays, Commercially Considered," "Buying Mining Machinery," "Gold Mining and Milling in Georgia," "High Mining in Colorado," "Wireless Telegraphy Without a Coherer," "Bullion at U. S. Mints and Assay Offices," "Mine Values," "The Occurrence of Gold," "Outcrops and Croppings," "Of Interest to Owners of Refractory ore," "Method of Handling Timbers," "Tunneling Record at De Lamar, Idaho," "Notes on Handling Dynamite," "Gold Mining in California's High Sierras," "Pacific Coast Iron and Steel Manufacture," "Silver-Plating of Amalgam Plates for Gold Mills," "That Deadly Gas," "Cyanide Plant at El Dorado Canyon, Nevada," "Self-Righting Mine Skip," "Masonry Dams and Retaining Walls," "General Formula for Ore Fluxing," "Favorable Smelter Locations," "Some Sample Inquiries and Their Answers," "New Device for the Surveying Engineer," "A Door Closed to Miners," "Some Notes on Gold Dredging," "Something New in Engineering," "The California Copper Co.'s New Plant," "Hydraulic Mining in California," "Mining and Scientific Education," "A Standard Ohm," "Treating Amalgam and Retorting," "Wet Crushing and Cyaniding Siliceous Ores of the Black Hills," "Details of Cost of One Year's War Eagle's Mine Operations," "Proper Testing of Gold Dredging Ground." That is but a partial list of the original articles so appearing in this paper in the past weeks. The list shows how valuable to any miner is such a paper. Any one of the seventy-nine specified is considered worth the small amount charged for an entire year's subscription of fifty-two such issues. An annual subscription thereto is about as profitable investment as can be suggested. Many of these articles, when received in manuscript, were accompanied by sketches, photographs, etc. The sketches were redrawn to scale, the photos suitably engraved, and the illustrations accompanying the published articles made them all the more interesting. The question for any real miner who wants to keep up with the march of mining progress is not "Can I afford it?" but "Can I afford to be without it?"

Profitable Mining of Low Grade Ore.

Mention was made in the issue of the 10th inst. of $2 ore being mined and milled at a profit; and in answer to a question as to where, in the issue of the 17th, were cited some instances. Among those mentioned was the Atlantic mine at Houghton, Mich. During the week has come a copy of the annual report of that mine, in which occurs the following paragraph:

The low yield of the rock, which was noted in our last report, continued during the first seven months of the year, reaching the lowest point in the history of the mine, or an average of $11\frac{58}{100}$ pounds of copper per ton of rock stamped. A change for the better then began, and the yield improved gradually, giving an average for the last five months of the year of $13\frac{28}{100}$ pounds per ton, and for the entire year an average yield of $12\frac{28}{100}$ pounds per ton.

It is to be noted that the official report of the company fully bears out the previous editorial statement made herein. During the year the company's production sold for $802,304.51; its expenses for that time were $573,027.48, showing a profit for the year of $229,777.03—this on ore some of which went but $11\frac{66}{100}$ pounds of copper to the ton, or, at 16 cents per pound, $1.85 per ton.

THE strike of the machinists from Chicago eastward is not likely to affect in any material way trade or manufacturing conditions west of the Missouri. There are about 150,000 machinists; of these about 70% are members of the International Association of Machinists. Their present claims are for a nine-hour day, a minimum wage scale, and limited placing of orders in different shops. It is thought that geographical conditions alone will preclude probability of any movement other than sympathetic on the part of the machinists throughout the western half of the continent, as the grievances complained of have no local existence, there being general good feeling and harmonious understanding between employes and employers in this region. The matter is of importance in connection with the activity in the mining industry and the large number of orders for mining and structural machinery now on the books of every manufacturer all over the country, in Colorado and on the Pacific coast. Chicago is the present storm center of strife. The machinists' officers claim that if a general strike is ordered 90,000 men will go out. San Francisco has had salutary experience with this thing, and it is not at all likely that Pacific coast machinists will be active participants in the present differences.

Concentrates.

A PHOTOGRAPH can not be copyrighted.

NO PARALLEL SIDE LINES, no extralateral rights.

CORPORATION STOCK, in California, is not legally non-assessable.

IN California the election of a non-stockholder as director in or of a corporation is not legal.

ARIZONA'S mining law does not allow the relocating of claims to avoid assessment work—a salutary act.

SNOWSHOES on horses are not unknown in California, being occasionally used in Plumas and Sierra counties.

"ROCK IN PLACE" is any rock, mineralized or unmineralized, in the solid mass of the mountain, other than float.

CLEANLINESS, care and the use of zinc and common soda aid greatly in preventing pitting and corrosion of boilers.

THE August, '99, gold output of the Rand, South Africa, was 459,710 ounces The October output is stated to have been 63,000 ounces.

A CUBIC FOOT of quicksilver weighs 847.89 pounds. In a column of quicksilver every foot in height gives a pressure of 5888 pounds per square inch.

SINCE the admission of Utah as a State, the territorial law against foreign mining investments is abrogated, and aliens may secure mining property therein.

THE California State Mining Bureau at San Francisco will make a qualitative test of any new or peculiar mineral specimen forwarded to it, but does not make assays or quantitative tests.

MINE SHOES AND DIES wear at different ratios in different places. The cost of wear per ton of ore depends on price, from 2 cents at Homestake, S. D., to 13 cents at Mammoth, Arizona.

THE question as to alien ownership or occupation of mining ground in this country can only be raised by the federal government, and usually does not come up till application for a patent.

WHEN a mining location is made in the United States by a corporation, all the stockholders at the time of such location must be citizens of the United States. McKinley vs. Wheeler, 130 U. S. 630.

NO ADVICE can be herein given as to the purchase of any mining stock. "Buy when they are cheap and sell when they are dear" may, however, continue to be quoted, as it can not be improved.

A LODE includes everything between the hanging and foot walls, and, even if outside, there may be an impregnation of country rock of equal value to that in the fissure, that also is a part of the "lode."

A PROTEST against the issuance of patent to a claimant to a mining claim by any one not claiming any interest in the mining claim itself must be filed in the local land office at any time before the patent is issued.

A CANTILEVER, strictly speaking, denotes a girder fixed at one end and otherwise unsupported. The collective term "cantilever bridge" is usually applied to a bridge structure of which a cantilever forms a component part.

THE Woods dry placer miner, manufactured by Fraser & Chalmers, Chicago, might be a good machine of the kind asked about, as they claim that it will handle material not dry, if the moisture therein be not sufficient to cause it to clot.

FROM 2600 tons of California ore, assay value $13, it would be fair to assume a gross value of $10,000 caught on the plates, and about 300 tons worth, gross, $50 or $60 per ton. With ordinary milling, that amount of such ore should yield $25,000, gross.

WHAT is said to be a satisfactory solvent for gold and silver is afforded by heating a dry mixture of one part of potassium ferrocyanide with about two parts of common salt to incipient fusion, the product to be poured into molds, and, for use, to be dissolved in water.

THERE should be no prejudice among miners against a mining "expert," provided he is a real expert. He is a good friend to the miner, has killed many swindles and caused the opening of good mines and the investment of capital, and has encouraged the honest promoter.

IT is the as yet unrealized hope of scientists to generate electricity direct from coal. It is not to be considered impossible. It can not, however, be assumed that any method may be devised of consuming zinc to compete with coal in the indirect production of electrical energy.

LOCATIONS of minerals upon the public domain in this country are confined exclusively to citizens of the United States or to those who have declared their intention to become such; but in this regard a corporation is considered a citizen, and so are a woman and a minor, and they may each make valid mining locations.

GOLD AMALGAM may be liquid, pasty or solid, according to the proportions of the metals present, and the purity of the amalgam. When mercury is present to the extent of 90% the amalgam is liquid; when the percentage of mercury decreases to 87 the alloy becomes pasty, and when only 84% is present the amalgam crystallizes.

UNLESS in case of shutting down or complete cessation of work the destruction of plates for the sake of the absorbed amalgam is not considered good mill practise or effective economy. The greatest absorption of gold takes place in the first few days of the run, and thus the larger part of the value recovered by destruction of the plate is immediately taken up from the daily amalgam.

IN sampling ore the sample should show the average value of the ore as mined, including all that goes with it. The biggest item of expense in handling gold ore is in the mining, not the milling of it, so that a sample should represent what is to be mined. Whether it is all going to be put through the mill or not is another matter.

AN excessive use of quicksilver in a stamp battery will run the greater part of the amalgam into the sluices. Acids or cyanide of potassium are not recommended in cleaning the plates, there being a tendency to burn and harden the copper. The cost of mining and milling per ton is usually determined by dividing the total tonnage mined and milled into the total costs; the yield per ton is the tonnage milled divided into the gross bullion product.

IT is always business, and usually necessary, to secure a U. S. patent to a mining location. The possession of such a title argues powerfully for the owner's belief in the value of the property. It is, also, almost an axiom that few mines can lay claim to real greatness or value until or unless it has been held up in court by some pirate with a shadowy claim to an interest in the property, and in such likely case a U. S. patent provides "an ironclad potency" that is of most value when most needed. Then, too, it is a matter of profit to the publisher of the paper nearest the property and usually he has helped to make the property worth patenting by frequent and friendly allusion to it.

IN testing drinking water for purity, if lime is suspected, put two drops of oxalic acid into a glassful of the water and blow on it. If it turn milky, lime is present. For lead evaporate by gentle heat a little of the water nearly to dryness in a clean porcelain cup; moisten the residue with acetic acid and add to a portion of it a few drops of strong hydrosulphuric acid; a black precipitate indicates lead. A few drops of common syrup added to water will cause it to turn green if it contain earthy matter. If iron be present a little prussiate of potash will cause the water to turn blue. These are only simple tests. In a case of importance, analysis by a competent chemist is necessary.

IN electrical transmission it is best to follow success, to let others with capital experiment, and to employ proved methods. Line losses may be reduced by employing thicker conductors and higher voltages. Both involve increased outlay. In case of possibility of cheap production by water power the most economical way is to lay down the simplest and cheapest hydraulic plant, to generate a current at a low temperature, to spend as little as possible in copper by using the least metal section consistent with security from overheating and breakage, and to let the big concerns experiment with aluminum or anything in which the factors of success have not been fully determined.

FOR the measurement of the energy output from a monocyclic electric generator a single monocyclic primary meter may be used having potential connections to a primary meter transformer and series connections precisely similar to those of the monocyclic power meter. For the measurement of energy on monocyclic primary circuits carrying heavy motor loads, two meters are desirable to secure the most accurate results. Where two meters are used, the second instrument is connected in series with the teazer circuit, and its potential connection is brought out from the center of the primary winding of the primary meter transformer. The second meter is, therefore, wound for one-fourth the potential between primary mains.

THE size of a boiler has no relation to its pressure, which is always quoted as the pressure per square inch of surface of the containing shell or tubes. The gross strain on the metal is in proportion to the size. The thickness of the shell is increased in large boilers. The power of a boiler is not alone due to its pressure; the volume of steam that a boiler can furnish at a rapid pressure is the measure of its power. The heat of steam when confined is a measure of its pressure, and the reverse. Steam in the boiler at eighty pounds pressure is 37° Fahr. hotter than the steam at forty pounds pressure; as much heat may be obtained from the low-pressure boiler, for ordinary purposes, as from a high-pressure boiler, but a larger volume of steam must be used.

TO TEST potassium cyanide solution for small quantities of cyanic acid is a delicate chemical process that requires careful manipulation. The cyanide solution must be closely concentrated. Where potassium cyanide can be procured for the test in considerable quantity it should be dissolved in as little water as possible, most of the cyanide present dissolved out by absolute alcohol. Through the alcoholic solution filtered off from the potassium cyanide, carbonic acid is then passed to decompose the remaining cyanide. The potassium carbonate thus formed is filtered off and the filtrate tested with cobalt acetate. Gradual and gentle heating of the alcoholic solution while the carbonic acid is passing through aids the removal of hydrocyanic acid. If the operation is properly performed it is possible to detect from 1 to 0.33 parts of potassium cyanate in 100 parts of potassium cyanide.

A CUBIC INCH of water evaporated under atmospheric pressure is approximately converted into 1 cubic foot of steam. The horse power of boilers as per standard adopted by the Am. S. M. E. is thirty pounds water evaporated per hour at a pressure of seventy pounds per square inch and from a temperature of 100° Fahr. Well-designed boilers under successful operation will evaporate from seven to ten pounds of water per pound of first-class coal. Each square foot of heating surface is considered to evaporate two pounds of water. Therefore, for an engine using thirty pounds water per horse power per hour, each horse power of the engine requires 15 square feet heating surface in the boiler. On 1 square foot of fire grate can be burned on an average from ten to twelve pounds hard coal, or eighteen to twenty pounds soft coal per hour with natural draft. Two and one-quarter pounds of dry wood is equal to one pound of average quality soft coal.

FORMULÆ for making flashlight powder have been so often published herein that repetition should be unnecessary. The best way, the safest procedure, is to buy ready-made magnesium compounds. There is always danger to the inexperienced in making or using these powders. A simple and comparatively safe method is as follows: Get one ounce magnesium powder and one ounce negative gun cotton from some reliable dealer in photographic material. Put on a dust pan enough cotton when pulled out to measure about 3½ inches diameter; sprinkle this over with twenty grains of the magnesium powder—enough to form a thin, even film. Lay over the magnesium thus arranged a very thin layer of gun cotton. Connect to the bunch of cotton a small fuse of twisted cotton about 6 inches long, so that it will extend to the side of the dust pan. Then set the pan on a stepladder near whatever is to be photographed, and, when ready, light the gun cotton fuse with a match; a brilliant flash will instantly ensue.

AN "ore break" is a local Colorado term for a "fissure vein," or a "break" in the rock accompanied by ore. Sheeting or multiple fissuring is thought by some to be due to shrinkage accompanying the cooling of the volcanic rock. A line or region of weakness is considered likely to be a line of least resistance for future fracturing, and even though a quartz vein may form along a line of rupture, healing the rock and strengthening it with a substance harder than the wall rock itself, it is supposable that the next break will take place along the line of weakness presented by the imperfect cohesion existing along the plane of contact between the hard quartz and the less resisting rock. Such gradual penetration of mineral solutions into the immediately encasing country may finally obliterate divisions due to multiple fissuring. Sheets of rock separating one from the other would be replaced by ore, and thus nothing remain of the original structure except faint partings in the lode, such as are less evident to the eye than to the hand of the miner, who instinctively uses them to assist him in breaking ore.

THE rain falling on the rocks sinks into every crack and crevice, carrying with it into these fissures surface material which has been degraded by the weather, and thus affording a matrix sufficient to start the growth of vegetation, and afterward to maintain the plants. The fibers and roots of these plants, bushes, and trees thus brought into life, growing and expanding, act as wedges to split up the surface of the rock and to commence the process of wearing away. From this quality of destruction a large class of plants derive the name of Saxifrages, or rock breakers, from their roots penetrating into the minute fissures in search of water, and so assisting in the process of disintegration. In winter the water collected in the hollows and crevices becomes frozen, and expanding as it changes into ice, acts like a charge of blasting material in breaking up the rocks. The pieces thus detached become further disintegrated by frost and weather, and, being rolled over and over and rubbed against each other as they are carried away down the mountain currents, are ground gradually smaller and smaller, till from fragments of rocks they become boulders, then pebbles, and finally sand. As the mountain stream merges into the river the pebbles and coarse sand continue to be rolled along the bottom of the channel, while the argillaceous particles and salts become mingled with the water, and flow on with it either in suspension or solution.

IN assaying for metallic mercury or for cinnabar, reduce the ore to a fine powder, so that the sample to be assayed will all pass through a sieve of 2000 holes to the linear inch. Weigh out from ten to twenty grains of ore, according to its richness; intimately mix with five to ten times its weight of finely powdered litharge and distill in a small glass retort over a spirit lamp. The retort is to be heated very gradually at first over the spirit lamp, and, finally, the heat is raised until the assay is fused, and the glass softens and nearly melts. The greater portion of the mercury will be found in the receiving cup, but small particles will generally be found in the condensing tube. Heat the tube slightly, which will bring the minute globules of mercury together; remove them carefully with a feather and add them to the globules in the cup. The retort and its fused contents should now be broken up in a horn spoon or porcelain dish, in which a small quantity of water has been previously put, and, after vanning, examine carefully with a magnifying glass to see if any globules can be found. If they are, the assay should be repeated. Slightly heat the receiving cup over the lamp, taking care to have it half full of water. The fine globules of mercury will then unite in one globule. Pour off the water, and dry the mercury with blotting paper; remove to a small weighing cup and ascertain its weight on the balance. The mercury so obtained can be considered pure.

Successful Precipitation From Solutions Weak in Cyanide.

Written for the MINING AND SCIENTIFIC PRESS by MATT W. ALDERSON.

In a contribution to the MINING AND SCIENTIFIC PRESS last year ("Cyaniding Slimy Ores and Tailings," issues of June 2, 9, 16, 23 and 30, 1899), I dwelt at length on the most important phase of cyaniding—precipitation. In that article I detailed the system by which I had succeeded in precipitating from solutions containing as great a quantity of cyanide as half a pound to the ton, and gave the theory on which the result was apparently brought about, based on experiences in actual work. Further experiments have not only led to modifications of views then entertained, but to successful precipitation from solutions containing hardly more than a trace of cyanide.

Based on the fact that I had removed heavy incrustation from zinc with strong cyanide solution, and that with this incrustation removed perfect precipitation had followed from solutions weak in cyanide, I conceived the idea of placing a small quantity of cyanide in the entrance to the extractor as frequently as once in every six hours. I supposed by so doing I would cause the zinc to stand for a short while in very strong solution and that in this way any incrustation on the zinc shavings would be removed. The incrustation which prevented or retarded precipitation was kept from forming, and the theory was supposed to be sound. Curiosity, however, prompted a test to see how strong in cyanide the solution became after the cyanide salt was added to the head of the extractor, with the following result:

The solution entering the extractor carried seven-tenths of a pound of cyanide to the ton. One and a half pounds of cyanide were then placed in the entrance of the extractor and the solution was allowed to run through slowly, the effluent being carefully tested.

Strength in cyanide in eight minutes, 1.5 pounds; strength in cyanide in twenty-three minutes, 2.2 pounds; strength in cyanide in thirty-five minutes, 2.1 pounds.

The speed of the fluid was then increased to the rate of over one ton an hour and samples tested gave results as follows:

Strength in cyanide in	45	minutes	.....1.7	pounds
"	" 60	"	.....1.1	"
"	" 75	"	.....1.1	"
"	" 90	"	.....1.0	pound
"	" 120	"	.....1 0	"

Here was an apparent upsetting of the theory which had led to the adoption of the system, and extra care was taken to see if there was any change in results; but precipitation was always perfect, contrary to the experiences of all who say that it is necessary for the fluid entering the extractor to carry from $\frac{1}{10}$ to $\frac{2}{10}$ of 1% of free cyanide (two to four pounds per ton) to secure perfect precipitation.

The curious fact was developed that the cyanide salt placed in the head of the extractor did not disseminate itself speedily throughout the solution, but even, though dissolved, seemed to be taken up gradually. A further test as a check, covering longer time, gave results as follows;

The solution entering the extractor registered six-tenths of a pound to the ton. One and a half pounds of undissolved cyanide of potassium were placed in the head of the extractor and the outgoing solution was then tested:

Strength in cyanide in	1	minute	.9	pound
"	" 8	minutes	.9	"
"	" 18	"	.9	"
"	" 28	"	.9	"
"	" 38	"	.9	"
"	" 48	"	.9	"
"	" 1 hour and 42	"	1.5	pounds
"	" 4 hours " 20	"	.9	pound
"	" 7 " " 15	"	.8	"

The condition of the zinc shavings at this time was always perfect, and the indicators showed no evidence of incrustation. On the contrary, the precipitation was such that the zinc discs, used as indicators, as I have heretofore described, were rapidly disintegrated.

In the comprehensive article by Prof. S. B. Christy on "The Solution and Precipitation of the Cyanide of Gold," (see MINING AND SCIENTIFIC PRESS, Jan. 23, 1897), that gentleman says:

"I had prepared a solution of potassium auro-cyanide with about 1.3% metallic gold and no free cyanide. A solution made from this by dilution, so as to contain 0.1%, or $603 per ton, gold, was then treated with strips of sheet zinc for twenty-four hours. The strips were carefully burnished with emery paper, or with a sharp knife, to avoid any film being left on the surface of the zinc. Commercial sheet zinc was used, as is done in practise. The solution was contained in glass tubes, sometimes at rest, sometimes rotated mechanically for the whole period of twenty-four hours.

"In no case was more than a trace of gold precipitated. In many cases, where the zinc was brightly burnished, not a trace of gold came down, and the strips weighed exactly the same to a hundredth of a milligramme before and after the test, and when dissolved in sulphuric acid left no trace of gold."

Prof. Christy precipitated this gold without difficulty on zinc shavings, and, continuing, says:

"These differing results are very difficult to explain on the simple substitution reaction usually accepted. If the gold precipitates on the shavings, why should it not do so on the same sheet of burnished zinc from which the shavings were made? There is a larger surface of contact, it may be suggested. But even the smallest fragment of a zinc shaving will precipitate gold on itself, while in the same solution the freshly scraped surface of sheet zinc, many times its area, is entirely or practically without action. It may be thought that the turnings had a cleaner surface than the scraped zinc, but this cause was carefully eliminated.

"All the indications point to the phenomena of 'polarization,' so well known in electrolytic work, where the formation of invisible traces of films on the surface puts a stop to further action, either by preventing contact or by setting up an opposite electromotive force."

The accompanying illustrations tell their own story. Fig. 1 is of an ordinary zinc disc (after the major portion has been removed on the turning lathe). This disc was purposely left a little larger than usual. It has an inch hole in the center and measures 3¼ inches across. Fig. 2 shows a similar disc after remaining for some time subject to the precipitating action of potassium auro-cyanide solution. Fig. 3 shows the remains of a disc left for still longer time in the extractor. The originals of these interesting specimens can be seen at the office of the MINING AND SCIENTIFIC PRESS. They are proof that gold can be successfully precipitated on sheet zinc under ordinary conditions, and would seem to controvert the experience of Prof. Christy. But let us examine further. Continuing his investigations, Prof. Christy says:

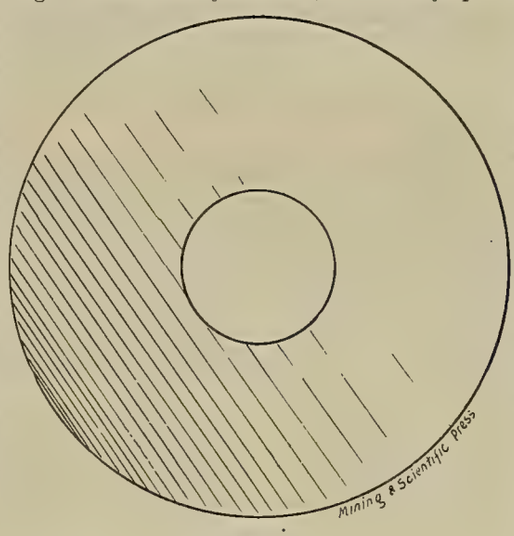

Fig. 1.

Fig. 2.

"When to a solution of potassium auro-cyanide which has been left for twenty-four hours in contact with zinc strips, without action, a little free cyanide of potassium is added, the gold comes down at once and the precipitation is soon complete. This fact seems an additional confirmation of the reaction that I have suggested. It will be remembered that the formation of the insoluble cyanide of zinc is a feature of this reaction. If this occurs, it is certain that a film of this substance, perhaps infinitely thin, must cover the surface of the zinc, and, in addition to the film of hydrogen, prevent the contact necessary to continue the reaction. The presence of free cyanide of potassium, of course, readily dissolves this film and the reaction is free to continue."

I have quoted at length from Prof. Christy's article because of the importance of his investigations and the fact that his results and conclusions offer the most lucid explanation of the reactions which take place in the extractor, confirmed as they are by results in actual practise.

The conclusion of the whole matter is that imperfect precipitation comes from films of one kind or another on the surface of the zinc, kept from forming in most cyanide plants by the use of very strong solution—two to four or more pounds of cyanide to the ton. With the addition of a little free cyanide to the head of the extractor, these films are removed, and for a reasonable time as perfect a precipitation can be effected with a weak solution as with a strong one. The past summer, when treating some tailings at the Schmidt & Johns mill, at Silver Star, Mont., the consumption of cyanide was greater than usual, and some of the strong solution entered the gold vat and extractor, carrying but two-tenths of a pound of cyanide to the ton. The precipitation in this instance was in every way as perfect as if the solution had carried ten pounds of cyanide to the ton. It is not only possible, theoretically, and on a small scale, to precipitate on zinc shavings from solutions weak in cyanide, but it is done every day in Montana on large-scale work, where thirty or more tons a day pass through an extractor.

I am aware that several criticisms of positions taken by Prof. Christy have been published, and Alfred James, to whom cyaniders are certainly indebted for many helpful suggestions as aids to precipitating from auropotassic solutions low in cyanide, in a friendly criticism of the article by Prof. Christy from which I have quoted, says: "Prof. Christy goes out of his way to assume the necessity of the presence of free cyanide of potassium." In the next paragraph, it seems to me, Mr. James confirms the stand taken by Prof. Christy, for, after explaining his idea of the difficulty of starting the precipitation when using very dilute or KCy free solutions, he says: "In practise this difficulty is seldom encountered except when starting a new plant, and may be easily overcome by adding a little free KCy to the boxes at the outset." (See Transactions of the American Institute of Mining Engineers, Vol. XXVII, page 835).

With deference to the opinions of so distinguished an authority as Mr. James, and his idea that the secret of successful precipitation from solutions low in cyanide is in giving long contact with the zinc, I must say my experience is quite to the contrary. With the zinc in perfect condition, large quantities of zinc and long contact therewith are unnecessary. Where Mr. James would use 1 cubic foot of zinc shavings to the ton of solution passing through the extractor each twenty-four hours, less than half this amount has been in use with us in Montana the past summer. I quote in this connection a letter recently received from one of my pupils, who installed a plant in an adjoining State the past summer. He says: "My precipitation has been most excellent the greater part of the time. I make my evaporations in tin pans and use ten assay-ton charges. The greater part of the time these ten assay-ton charges do not give a weighable button of gold from the zinc-box outflow. I am using but four compartments of my zinc box; it has nine, but, as the four give almost perfect precipitation, it is useless work to take care of more. The size of the zinc space is, in each compartment, 18 inches in depth, 15 inches in width and 30 inches in length."

Fig. 3.

The preference of most cyaniders seems to be for

zinc boxes with small compartments. Mine is decidedly in favor of such a one as is above described. (See illustrations in MINING AND SCIENTIFIC PRESS, June 23, 1899). With an extractor of such proportions, the gold solution is brought in intimate and immediate contact with a large surface of zinc, and oftentimes 90% of the gold contents of the solution will be precipitated on the first 2 or 3 inches of the zinc in the bottom of the first compartment. At other times, and with some ores, the precipitation will be more diffused; but it is very seldom that the precipitates in the second compartment are of value. My experience is that if you do not get your gold in the head compartment of the extractor, and it drags its way down through the compartments of a zinc box 20 feet or more in length, as I have seen in days gone by, the gold will still pass out at the outflow, in spite of all efforts to secure it. There are not many compartments in my zinc boxes to-day, and no apprehensions are felt if four of these are well filled with zinc shavings. With other conditions right, such an extractor will do perfect work.

In concluding, I think it well to express a few words of caution to the inexperienced. In starting precipitation in a new plant, or until, on pushing down the zinc shavings in the extractor, there is a good effervescence of hydrogen, the strength of the gold solution passed through the extractor would better be at least one pound of cyanide per ton. When the zinc is active, the solutions may safely be brought down to half a pound to the ton and occasionally to even less. The addition of the undissolved potassium cyanide to the head of the extractor should be made once every six hours. If left for periods as long as nine hours, especially with very slimy ores or those which produce more than the usual amount of silt, there is danger that films will form to such an extent as to interfere with and retard the precipitation. The system is valueless in the hands of careless persons or those who do not appreciate the value of method in their work.

Long Distance Electrical Transmission.

Most notable in science is the advance in electrical transmission of power, both in distance and voltage. In California has been obtained the highest measure of practical development, where an extraordinarily high voltage is successfully transmitted eighty miles.

In the New York Electrical Review appears an article on this subject from Louis Bell, which takes up the matter of even longer distance electrical transmission in a practical way. He premises that the limit of power transmission in distance and voltage is necessarily indeterminate, for the distance practicable is a function of the price of fuel and the voltage is in the main a function of the climate, and goes on: "To make a trial at very long range and extreme voltage feasible, the necessary combination of circumstances consists of a good market, a very high price of coal and a climate dry enough to make insulation easy. Given these conditions and we may reasonably expect something of a revelation in the way of power transmission. To the best of the writer's knowledge, the one region to which one may reasonably look for the next great step is the neighboring republic of Mexico. A few years since there came to the writer a most intelligent Mexican gentleman with a proposition for power transmission on a scale that was fairly startling. It involved sending 1000 H. P. over a line 200 miles long to a group of silver mines in the mountains.

"At first it looked rather desperate commercially, but on careful investigation it showed every indication of being a paying proposition. At the mines in question coal cost $40 per ton in gold, for every ounce of it had to be carried eighty miles in bags on the backs of burros. The water power was one of the magnificent high heads common along the backbone of the continent and was not itself inaccessible, while over most of the route rain was a sort of septennial institution not to be seriously considered. All this was seven years ago and the slump in the price of silver put the proposition to sleep shortly afterward, but it will be instructive in the light of our present experience to compute the proposition anew and to see the possibilities it opens to both commercial and electrical enterprise.

"To begin with, we must realize that the present upper limit of high voltage seems to be set by the tendency of the air to fail as a dielectric. So far as the transformers are concerned the splendid insulating properties of oil have not been put seriously to the test by even the highest experimental voltages. Given the necessity and there would be no serious difficulty in the way of building large transformers to deliver to the line pressures of 100,000 volts or more. Glass and porcelain and oil will stand the strain. But the air begins to play one false long before this. With ordinary commercial machines at ordinary frequencies the losses by leakage through the air between line and line are sufficiently formidable at 50,000 volts to call a halt in further progress and even with wires 4 or 5 feet apart. Ten or fifteen thousand volts more may be gained by using generators giving a close sinusoidal wave and spacing the wires still wider.

"For a working voltage one might safely go under existing conditions in a very dry climate to 60,000 volts. Let us see what sort of a line this will give. Take the energy generated at 1000 kilowatts and assume the distance as 200 miles and the loss at 10%.

"Using the stock formula for three-phase lines

$$\text{c. m.} = \frac{D + 11 + \frac{W}{V}}{V_1}$$

$$\text{one has } D = 1060,\ \frac{W}{V_1} = 20,\ V_1 = 5000,$$

and the case calls for 46,640 circular mils. This is not far from No. 3, which would probably be chosen for the purpose. As to the matter of inductance with wires about 6 feet apart and at a frequency of 40—, the impedance factor of the line is so near unity as to be amply compensated by the extra cross-section of the conductor, leaving the drop at just about the assumed figure. As to resonance the constants of the line do not give a period anywhere near the frequency, so that no trouble need be borrowed on that score.

"Now for the copper: About 3,200,000 feet of No. 3 would be required, weighing about 160 pounds per 1000 feet, in all about 512,000 pounds, worth, delivered, about $100,000.

"For the line one would need about 8000 poles, and for a rough estimate of the cost, set with wire in place, allow another $100,000. Hydraulic costs are very variable, but taking our data from a typical high head plant of this capacity will give a useful approximation. Fifty thousand dollars is not wide of the mark for this item, and allowing a proper amount for dynamos, transformers and general equipment, including the very necessary telephone line, it is quite safe to say that the total cost of the plant, including a moderate amount of distributing circuit, would fall within $350,000.

"On this amount 20% should easily pay all fixed charges and operating expenses, so that a sale of 1000 H. P. at $100 per H. P. year, would not only care for all the fixed expenses but pay interest on the stock of the concern and provide a liberal sinking fund. Now, in point of fact, the price noted is less than the cost of producing power in units of moderate capacity, even in localities where coal is no more than $5 or $6 per ton. If coal rises from transportation charges to the neighborhood of $10 per ton, electrical power, transmitted even so great a distance, could cut under the cost of steam power very materially and secure a paying market. On a larger scale, the cost of transmitted power would, of course, fall below the estimate given, and by so much the more give it the advantage. There is every reason to expect, then, that a 200-mile transmission from water power would pay in a good many instances, given only a reasonably good market. Obviously it would pay handsomely under conditions anything like those noted in beginning this article. There is little doubt that it would have been a good investment seven years ago in spite of the falling silver market, for it would have greatly reduced the cost of production at the mines concerned. Although it is not difficult to figure out a profit in even longer transmissions on a large scale, we are not likely to get capital interested in such enterprises until some case has been worked through to commercial success under conditions so favorable as to leave no doubt of the result. It is doubtful whether such conditions exist within the limits of our own country, although ultimately we may expect long distance work on a colossal scale.

"In Mexico and portions of South America, however, one may reasonably expect to find such cases as have been instanced, and it is to this quarter that we must look for the pioneering work that has to precede anything like settled practise. Possibly in a favorable climate it would be worth the while to experiment with voltage even above 50,000, with the help of very widely spaced wires and extraordinary precautions in insulation. Such a procedure of course increases the cost of the pole line, while decreasing the cost of copper alone, and at a certain point further increase would cease to pay. It is doubtful, for instance, whether it would pay to increase the distance between wires to the extent of using separate pole lines for each leg of the circuit, but there is still great room for improvement in line insulation in general. The engineering value of a very long transmission at extreme voltage would be very great, and the present note is intended to call attention to the fact that under circumstances which actually exist such an enterprise can have a commercial value fully commensurate with its scientific importance."

IN a recently published memoir by M. Biedermann on the production and relative value of gold and silver, he shows that in the year 1500 the world's production was 5.8 tons gold and 4.7 tons of silver, the relative value of the two metals being in the ratio of 10 to 1. From 1700 to 1870 the ratio varied from 15.20 to 15.51; since then it has doubled. The following institutes a comparison between 1872 and 1898:

	1872.	1898.
Gold production (tons)	173.9	435.1
Value (millions of dollars)	121.3	303.7
Silver production (tons)	196.9	593.0
Value (millions of dollars)	88.9	93.7
Relative value of gold and silver	15.9	35.2

A Modern Dredger Mining Plant.*

Written for the MINING AND SCIENTIFIC PRESS.

Recent accounts have appeared of gold dredging machines in successful operation in California, Idaho, Colorado, Montana and Oregon. The dredging system for recovering gold originated in New Zealand, but during the last few years has been successfully applied in the United States.

The Bed Rock Dredging Company, Philadelphia, Pa., and their associated companies have for two seasons carried on successful operations in placer mining at a point about thirty miles distant from Boise City, Idaho. Previously, direct current apparatus has been exclusively employed to operate motors upon dredgers, the current being generated either upon the dredger, or in close proximity thereto. The Bed Rock Dredging Company was the first to employ alternating current and polyphase motors for all their operations, the electrical equipments being supplied by the Westinghouse Electric & Manufacturing Company.

A district of about 200 acres of gold-bearing land was acquired by this company. Fifteen miles from the scene of the dredging a power house was constructed of substantial corrugated iron, measuring 20x30 feet. Current is generated by a 500-volt Westinghouse two-phase alternating current generator, direct connected to a Pelton water wheel. Water is conveyed to the wheel by a ditch eight miles long, having a capacity of 1000 miners' inches, i. e., 20 cubic feet per second. In many places the ditch has been blasted out of solid rock. From the terminus of this aqueduct a sheet iron pipe descends to the power house, and supplies the Pelton water wheel under a head of 350 feet. Fig. 1 gives a view of the pipe line. Figs. 2 and 3 show the water wheel connected by a flange coupling to the 400 kw. Westinghouse generator, running at 360 revolutions per minute, with a frequency of thirty gallons per second. The exciter, of the standard Westinghouse type of 125 volts, is belted to the water wheel, as shown in the illustration. In Fig. 4 are shown two 200 kw. Westinghouse transformers of the self-cooling, oil-insulated type, which raise the voltage from 500 volts two-phase to 10,000 volts three-phase for the transmission circuit. From the power house a three-wire three-phase circuit of No. 4 B. & S. gauge bare copper wire carries the current. The wires are supported on wooden poles and Locke high-tension porcelain insulators, with porcelain pin protectors to prevent leakage to pin.

About 600 feet distant from each of the three dredgers now in operation a small building has been erected, in which are placed the lowering Westinghouse transformers, reducing the pressure to 400 volts two-phase. A full equipment of Wurts non-arcing lightning arresters and choke coils is provided for the 10,000-volt circuits, to protect the generator and transformer stations.

The dredgers are known as the "ladder" or "elevator bucket" type, with a capacity of 3000 cubic yards a day, each of them having the following electrical equipment of 400-volt two-phase Westinghouse type "C" motors: One 75 H. P. motor operates a string of heavy buckets upon the ladder of the dredger, each having a capacity of 3¼ cubic feet, which discharge upon the delivery plate at the rate of thirteen buckets per minute. The working of this motor is controlled by a reversing switch and auto-starter. Two other 75 H. P. motors are direct-connected to centrifugal pumps for furnishing water to hold the screened dirt in solution and to force it along the sluice box for the washing process. The material dredged consists of boulders, cobbles, sand and gold, and is passed by gravity from the delivery plate into a perforated revolving screen set on a slight incline. The water thoroughly disintegrates and washes the material as it slowly passes down the screen. The water, fine gravel, sand and gold drop through the perforations in the screen into a distributing box, from which they pass on to the different sections of gold-saving tables by means of doors in the distributing box. The gold-saving tables are made of cast iron to avoid warping and leaking.

A 20 H. P. variable speed motor swings the dredger into necessary positions, and another 20 H. P. motor operates the grizzly and screen; both are controlled by reversing switches and auto-starters.

The controlling and starting apparatus for all the motors is placed in the cabin of the dredger, which also contains a complete outfit of indicating instruments, automatic circuit breakers and switches, conveniently arranged on marble panels, for observing and properly controlling the operations of the dredger. This arrangement permits one operator to supervise and regulate every movement.

The grounds surrounding the dredger are lighted by incandescent lamps from the 400-volt alternating current, through suitable transformers. The general scheme and details of the dredging operations were worked out by S. S. Harper, general manager of the several companies, and the successful results that have been attained are greatly due to his experience and judgment.

Cheap Mining and Milling at the Spanish Mine.

Written for the MINING AND SCIENTIFIC PRESS by HORACE F. BROWN, M. E.

About four miles northerly from Washington, in Nevada county, Cal., the now deserted Spanish mine stands as a monument to the energy and daring of man. Probably the record of this mine has never been equaled, and certainly never broken, for cost of operation and tonnage worked, in proportion to the labor employed. It is credited with paying a profit from ores carrying but 65 cents per ton, and has a special record for work still more phenomenal.

For years I have heard of mines that were considered valuable, the owners proudly claiming an average of $1 per ton, 35 cents more than the Spanish, and consequently far more desirable. It is very alluring to hear of mines where there is a vast amount of ore so much better than the Spanish, and a great temptation to the unwary investor, and I know of several parties who are contemplating the erection of a small plant on properties of their own, fondly thinking that they can repeat the success of that remarkable mine.

Such statements as are being made have their influence, and often to the sorrow of the victim, and it seems pertinent to give some of the conditions surrounding the work at the Spanish, and which must prevail to insure success in kindred enterprises.

The Spanish mine outcrops near the summit of a high, mountainous ridge that forms the north bank of Poor Man creek.

The vein partakes of the character of a massive blowout, being composed of numerous seams of quartz, porphyry, clay seams and broken masses of slate, etc., so broken and jumbled up at the surface as to appear very unlike a vein.

The foot wall stands nearly vertical and shows massive columns and abrupt faces several hundred feet above the bottom of the cut that has been quarried out. The hanging wall is composed of tilted masses of rock that stand at an angle that brings the seams flatwise to the pressure of the superincumbent earth, making an ideal wall for holding the top soil and loose rock back as the cut was quarried to depth.

The mass of ore was very wide at the surface, and in mining the hanging wall has been cut back so it becomes still more self-supporting.

Its stability, however, has been tested to the limit and the whole face is gradually creeping and crumbling so that further work is impossible.

Without noting the various tunnels that were driven in on the various seams and clay veins, reference will be made to the principal means of carrying on the work.

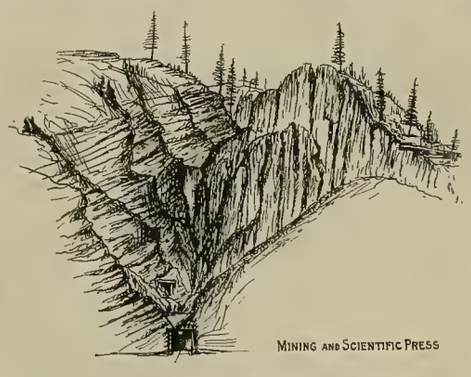
The principal tunnel is carried back under the mountain for about 750 feet, is well timbered and provided with several chutes for loading.

The method of carrying on the work of mining will be understood by referring to sketches Nos. 1 and 2.

From the various chutes upraises were made to the surface centrally between the walls of the vein or blowout.

Beginning at the surface, the vein was quarried off and dropped down to the chutes below. The work was carried on so as to at all times keep about an angle of 45° in every direction from the upraises. A vast amount of waste went down with the ore, and, it being impossible to sort or discriminate, waste and all went to the mill. With the most favorable conditions of walls, the work could not be carried on during the winter and early spring.

The rains and snows saturated the somewhat soft vein matter, and the action of frosts completed the disintegration of a very large portion, so that a few holes churned in were sufficient for blasting down almost a season's supply of ore for the mill. Owing to the slacking of the walls, due to exposure, the dangers and difficulties increased as depth was gained, until even Chinamen were loth to take the risk, and the work was abandoned.



The milling plant consisted of ten stamps and four Huntington mills. This plant was capable of crushing between 8000 and 9000 tons per month. The mill was fully equipped with automatic feeders and labor-saving devices, so that but a minimum amount of labor was required, and everything that experience could suggest to cheapen the cost was provided.

To facilitate the handling of the ore a most excellent side-dumping tipple was invented and perfected by the millwright, William Hogan, who afterwards patented the same.

The device consists of a short framework upon which a section of track is formed, and segments of a circle secured at each end hold the frame in position. These segments rest upon four wheels, placed in relation to the load so as to bring the tipple out of balance when loaded and the reverse when the car is empty. The cars used hold about one ton and are fitted with side doors and automatic coupling devices.

A train consisted of ten cars, drawn by a mule. This train was passed over the tipple, one at a time, and it required but one and one-half minutes to dump and couple the ten cars. The tipple is controlled by a projecting lever and held in position by a latch. The door fastenings project at each end and are automatically opened by means of fixed stops which engage with the latches as the car begins to dump.

When the car is on the tipple the wheels opposite the door are under a suitable guard, which suffices to hold the car firmly on the track. A slight depression in the track rail acts as a stop for the car, and by means of the lever the rapidity of the dumping can be regulated and the car held in position until all fine or wet material is discharged. The cars couple automatically and are ready for the return trip within two minutes from the time the first car is uncoupled, and often within one and a half minutes.

The Spanish Mine — Cross-Section.

This is given as an example of the devices and brain work that contributed so much to the success of the Spanish mine.

About 1000 feet from the mill there occurs a belt of gold-bearing rock similar to the softer portions of the Spanish mine.

A test run of thirty days was made on this material, the amount crushed being about 9000 tons. This was quarried in the same manner as in the main mine, and trammed 1000 feet, the cost of mining and milling, with all expenses connected therewith, amounting to exactly 25 cents per ton. The saving in the mill just equaled the expense, and it was decided that 25-cent ore was rather too low grade for profitable working. This is probably the best record ever made for mining and milling.

I append a sketch to show a plan for semi-quarrying of ores where conditions are not favorable for full open-cut work, as explained to me by James White, who was for several years connected with the management of the Spanish mine.

The vein is first opened by a tunnel A and chutes. From the chutes upraises are made each way, as shown at B, and from the apex of the angling upraises a vertical upraise is put to surface C. The raises B from the chutes are filled with surface waste, quite full, a bulkhead at the bottom preventing the waste from entering the chute.

Stopes are then run in the roof of each angling upraise, using the waste as a floor to carry the ore to the chute. This gives a loose end for blasting and forms a chute that carries away all the ore without shoveling or other handling.

Sufficient space will be left along the roof after each filling to admit of ventilation, and using the top debris for filling the stopes not only relieves the mill of crushing an enormous amount of waste but supports the walls and makes timbering unnecessary. In this manner mines can be worked to any required depth with safety, while with open quarry work the depth is limited owing to the danger of falling walls, etc.

It also makes it possible to confine the work to any strata of the vein, instead of taking everything between country rock, as in open quarry work.

As each successive stope is taken out the space is filled, the bulkhead at the chute serving to continue the chute upward, making increased storage for ore until the surface is reached.

The chute should be carried up as a double-compartment shaft, the smaller compartment serving as a manway.

The apexed pillars of ore that are left in the bottom serve as a protection to the tunnel, and after the mine is exhausted can be mined out, to a large extent, with safety.

The practicability of this scheme of mining would depend on local conditions, of which each one must be his own judge, but, having been developed from years of experience at the Spanish mine, is worthy of consideration.

[The following is a record of one month's run of the mine, prepared from the superintendent's report:

MINE—COST OF PRODUCTION.

RUN—TWENTY-EIGHT DAYS' WORK PRODUCED 3443 TONS OF ORE.

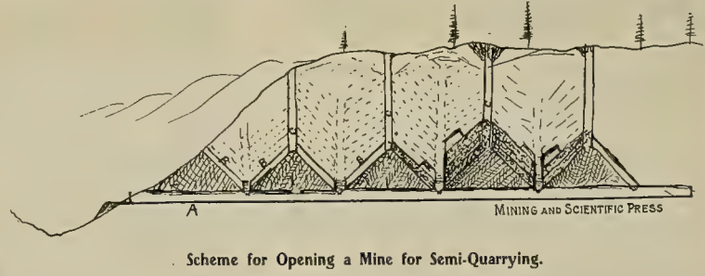
	Labor.	Supplies.	Total.
Extracting ore	$ 703 50	$113 41	$ 816 91
Delivering ore to mill	160 20	17 95	178 15
Dead work	105 20	10 93	116 13
General expense	78 35	1 95	80 30
Total	$1,047 25	$144 24	$1,191 49
Cost per ton	.304c	.042c	.346c

MILL—COST OF REDUCTION.

RUN—TWENTY-FOUR AND ONE-HALF DAYS REDUCED 3443 TONS OF ORE.

	Labor.	Supplies.	Total.
Mill expenses	$227 32	$194 33	$421 65
Water for power	.....	161 70	161 70
Handling ore	154 50	5 35	159 85
General expense	78 40	1 95	80 35
Total	$460 22	$363 33	$823 55
Cost per ton	.133c	.106c	.239c
Bullion produced			$3,138 55
Total expenses			2,015 04
Profit			$1,123 51

This run of ore yielded a trifle over 91 cents per ton; a profit of 32.6 cents per ton resulted. The percentage of profit was 35.8 of the total.—ED.]

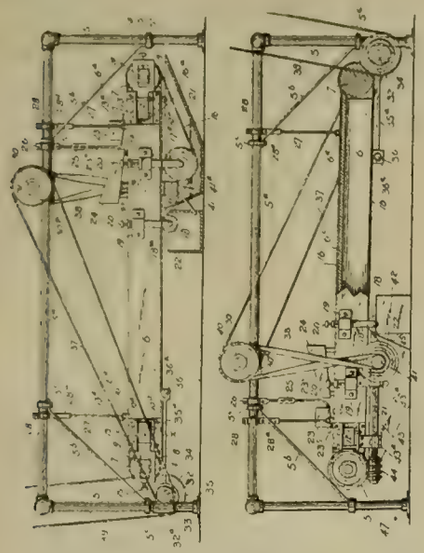


Apparent Requirements in the Case.

TO THE EDITOR:—Please answer through your "Concentrates" or otherwise, if a 2-inch pipe could be run from a 4 H. P. gasoline engine 500 feet underground to the outside through a tunnel where it would take two elbows? Would it take any of the power off of the engine, and could it be done successfully? I have one like that and the smoke bothers us so much we can not stand it and do not know what can be done with it. Would the size of the pipe make any difference?

There are two or three possible things which may cause the smoke of which our inquirer speaks. Possibly the piston in his engine has become worn and permits a considerable proportion of the burnt gases to escape by the piston instead of through the exhaust port. If such is the case, the cylinder should be rebored and a new piston made that will fit, though possibly new piston rings would prevent the escape of this gas. Two-inch pipe is not large enough to carry off the exhaust of a 4 H. P. engine, where 500 feet is required; more or less back pressure is created, which will interfere with the exhaust valve and reduce the power that he can obtain from his engine. It is suggested that he use say two lenghths of standard wrought pipe, 3 inches in diameter at the engine, and from the end of the standard pipe to the surface we would recommend 3-inch or preferably 4-inch riveted slip joint pipe. This is not expensive and will easily carry off all the exhaust gases without creating any back pressure. From reading the inquiry one might come to the conclusion that he has no exhaust pipe at present and is exhausting in the tunnel; if so, it is a wonder he or his men have not been suffocated.

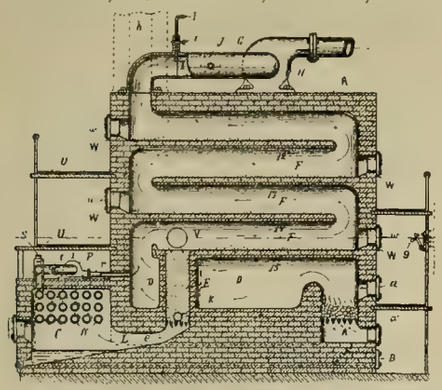
Spanish Mine — Section Along the Vein.



Scheme for Opening a Mine for Semi-Quarrying.

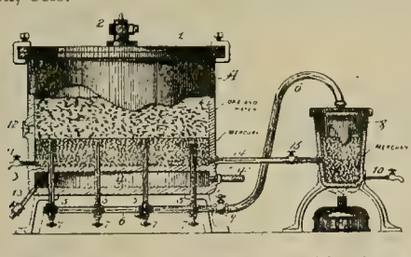
Latest Mining and Metallurgical Patents.

Patents Issued March 13, 1900.



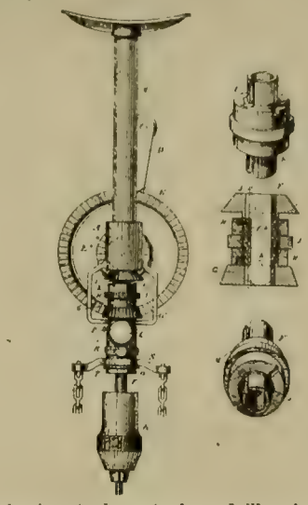
Spec'ally Reported for the MINING AND SCIENTIFIC PRESS.

VANNER.—No. 645,061; H. T. Benson, Denver, Colo.



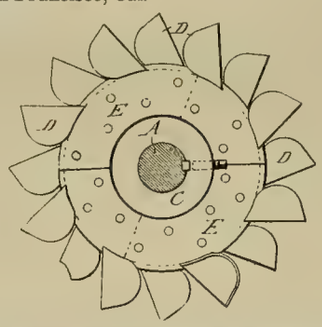
An ore-concentrator combination with frame of an oscillatory vanner box suspended therefrom, rolls located at ends of vanner box, shafts of rolls passing through bearing blocks 14 which are adjustable back and forth in recesses in the supports 12 by set screws 15; plates 10 provided with flanges 10^a to which rear ends of support 12 are hinged by hinge bolts 13^a passing through eyes in flanges 10^a and eyes in rear ends of supports; bolts 13 extending through eyes in flanges 10^a adapted to hold supports 12 against side rails 6; strips 10^c adapted to lie between flanges 10^a and top and bottom edges of supports 12 to a adjust height of supports, a tank 21, a roll 17 therein, and a traveling apron surrounding vanner box and its end rolls and passing under roll 17.

PROCESS OF REDUCING EASILY OXIDIZABLE METALS.—No. 645,178; C. W. Miles, Cincinnati, Ohio.



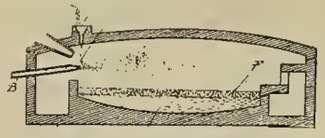
A process of reducing zinc ore consisting in supplying air to a body of fuel, passing the products of combustion around a mass of the ore and carbon, subdividing current of products of combustion, passing portion thereof though mass of ore and carbon, cooling vapor so produced and thereby condensing the metallic fumes, mixing the uncondensed residual gas with remaining portion of the current of products of combustion, and conveying them in contact with the raw ore.

SEPARATOR FOR GOLD AND SILVER BY AMALGAMATION.—No. 645,188; F. A. Rider, Vekol, Ariz., assignor to the Detroit Reduction Company, Cripple Creek, Colo.



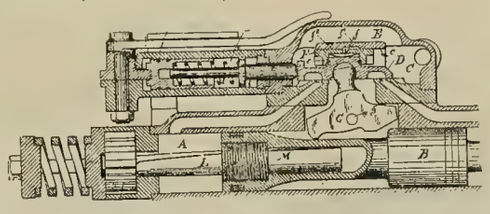
An amalgamating apparatus, combination with tight vessel having steam chamber in its bottom adapted to contain a body of mercury immediately above steam chamber and mixed water and ore above the mercury, of a series of jet pipes projecting up through bottom of vessel and adapted to terminate at or near surface of body of mercury, a separate mercurial vapor generator, and a pipe communicating with separate generator and with the jet pipes.

BORING DRILL.—No. 645,219; C. S. Stafford, San Francisco, Cal.



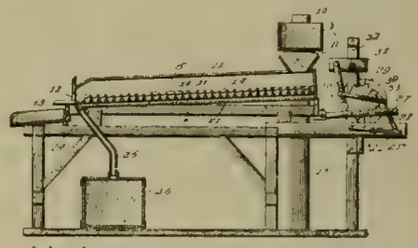
In a boring tool, a stock, a drill spindle turnable therein, a sleeve mounted on spindle, a driving gear journaled and turnable upon stock, and having outer and inner rows of teeth, pinions turnable upon sleeve, the teeth of one engaging the outer and the other the inner teeth of gear, a two-part collar loosely fitting sleeve between pinions having slots in ends adapted to engage corresponding lugs upon inner faces of pinions, a key or feather slidable in keyway in spindle having ends upturned to engage the two parts of collar and unite them so that they become one and move in unison, a disk turnable upon sleeve between inner ends of two-part collar having screw threads fitting corresponding threads on sleeve whereby collar may be advanced to engage either pinion and be disengaged from the other.

WATER WHEEL.—No. 645,221; S. T. Tutthill, Oakland, Cal., assignor to Tutthill Water Wheel Company, San Francisco, Cal.



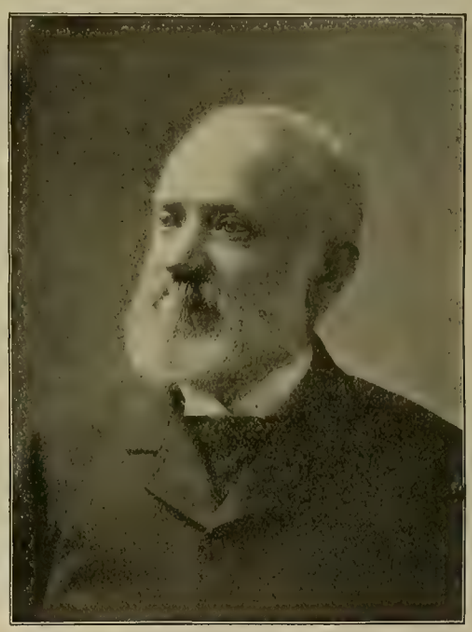
A water wheel consisting of disk hub and shaft to which they are secured, vertically disposed segments bolted flatwise against vertical sides of disk having radially disposed ends abutting directly against each other to form substantially a continuous plate on each side of disk whereby the strain upon bolts is equally distributed, segments each formed integral with a plurality of buckets with buckets on one side of disk occupying spaces between those on other side.

PROCESS OF REFINING IRON.—No. 645,205; F. W. Hawkins, Detroit, Mich.



A method of refining iron consisting in first atomizing or breaking up and scattering the molten metal into minute particles by a blast and in then filtering the separate particles through a heated bed of comminuted basic material.

ENGINE FOR ROCK DRILLS.—No. 645,536; P. H. Reardon, San Francisco, Cal.



A rock drill comprising a cylinder, a fluid-actuated piston therein, a slide valve in suitable valve chamber adapted to control the fluid, a tappet interposed between piston and slide valve to operate latter by motion of former whereby piston is reciprocated, a pressure-relieving device on slide valve consisting of a stationary surface between which and the valve seat the valve is located, and a loose plate socketed on back of valve bearing against surface and means for varying stroke of piston; a rock arm interposed between valve and piston whereby valve is moved by motion of piston in one direction directly and a spring adapted to move valve in opposite direction.

CONCENTRATOR.—No. 645,533; J. Mauldin, Sacramento, Cal.

A sluice box, a combination of longitudinal ribs 19, transverse bars 20, riffle plates 16 formed with riffles 17 presented with their vertical faces against the flow of water, overlapped with spaces 18 between them and secured upon the crossbars 20 the ribs 19, wedges 22 inserted between the overlapped portion of said plates, above crossbars, screws 23 passing through overlapped ends of riffle plates impinging wedges, and plates to crossbars.

Addison C. Rand.

Mr. A. C. Rand, President of the Rand Drill Co., New York City, died on the 9th inst., after a brief illness, aged fifty-nine years. He was born in Westfield, Mass., in September, 1841, and was a member of an old New England family, prominent since the settling of the colonies. He was one of the pioneers in rock drilling and air compressing machinery, and was identified with many of the mechanical and engineering societies. He had filled the office of treasurer of the Engineers' Club of New York City from its beginning, and, among other societies, was a member of the American Institute of Mining Engineers, the American Society of Mechanical Engineers and the Chamber of Commerce. He was a director of the New England Society, of the Ninth National Bank and of the Lafin & Rand Powder Co.

Mr. Rand's name will always be linked with the development of rock drilling and air compressing machinery. He was one of the first in this field of work, and while much work with drills had been done at the Hoosac Tunnel before his connection with the industry, their use was only possible because that enterprise had the State of Massachusetts behind it. The use of rock drills in civil engineering work on an economic basis began at the West Point Tunnel of the West Shore R. R., though the Haverstraw and Weehawken Tunnels soon followed. Following this came the tunnels of the abandoned South Pennsylvania R. R., and, soon after, the Washington and New York aqueducts. It seems almost incredible that an appliance, without which no large work of this character would now be attempted, could have been of so recent origin. Machine drills became an accepted fact in mining before they did in civil engineering work—the place of their birth, in an economic sense, being the iron mines which center about Port Henry, N. Y., though the iron and copper regions of Lake Superior district soon followed.

The Assay of Copper Materials for Gold and Silver.*

By L. D. GODSHALL, Spokane, Washington.

The extreme difficulty of obtaining a short and, at the same time, exact method for the determination of gold and silver in copper materials has been well illustrated in "Assays of Copper and Copper Matte," and its discussion by Dr. A. R. Ledoux and other leading authorities on this subject.

Two general methods were used by the numerous assayers who took part in the symposium initiated by Dr. Ledoux, and whose results are given in the paper and discussion. One of these is the dry, or fire method, consisting of scorification and cupellation, the former being repeated if the percentage of copper is very high, all slags and cupels being assayed, and the results so obtained added to the ordinary assay; and the copper retained by the silver buttons being determined and deducted from the combined weight of the buttons obtained from the assay of the original material, the scorification slag and the cupel.

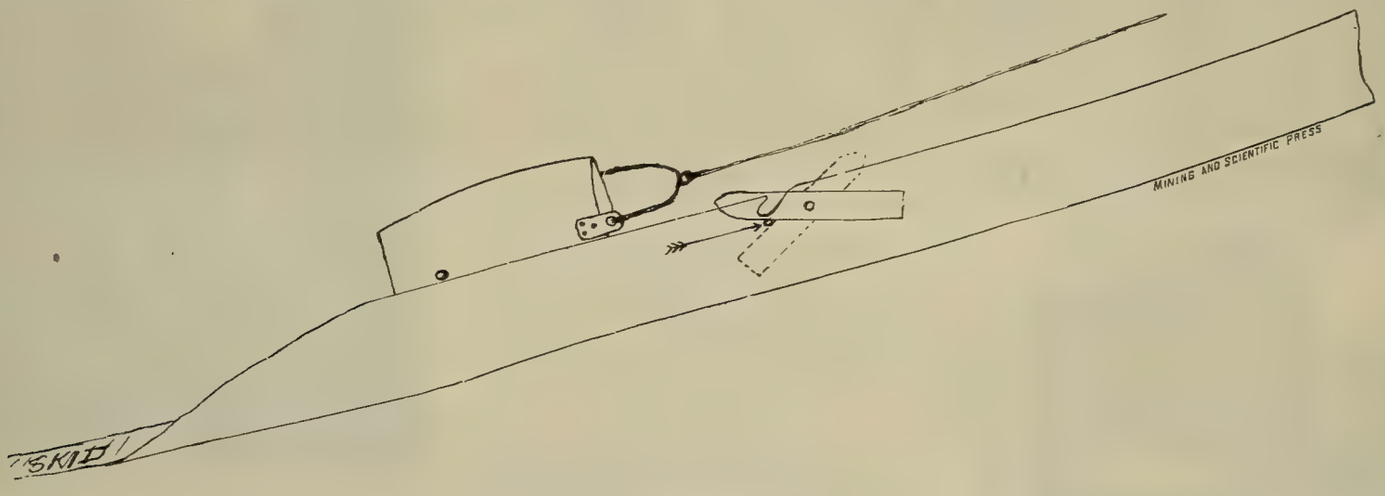
The other is the wet, or combination method, which, while not involving so much work, requires a longer time. Briefly, it is as follows: The material to be assayed is dissolved in nitric acid, the solution is diluted, and the fine undissolved gold is collected by means of sulphate of lead, formed by the addition of lead acetate and sulphuric acid to the solution. After standing from twelve to twenty-four hours, the precipitate is filtered off, and the silver in the filtrate is precipitated as a chloride or bromide and collected by means of sulphate or bromide of lead. The solution containing this precipitate in suspension is again allowed to stand until the precipitate has settled. It is then filtered; both precipitates, containing the gold and silver, are dried, ignited and scorified, either separately or together, and the result is cupelled in the usual way.

The above methods are open to several objections, the most important of which is the amount of work required for the one, and of time for the other. Moreover, the undissolved gold is naturally in an exceedingly fine state of division; the sulphate of lead, though heavy, is a fine precipitate, slow to filter, and, unless care is taken, liable to go through the filter paper. Again, in case any gold is dissolved, through impurities in the reagents, or from other causes, there are no means of detecting or saving it. In order to overcome these objections, the writer proposes to make use of two reactions, namely, the fractional precipitation by means of H_2S and the reaction between precipitated copper sulphide and a soluble salt of silver.

The method as proposed is, in brief, as follows: Take 0.5 to 4 A. T. of the material to be assayed (the quantity depending on the contents in gold and silver). Dissolve in dilute nitric acid, adding a small quantity of sulphuric acid at the same time. The latter is not absolutely necessary, but facilitates the subsequent removal of the excess of nitric acid. The nitric acid should be added in small quantities at a time, as required, to avoid too violent action and the use of a large excess. When the solution of the copper is complete, the excess of nitric acid is evaporated, and the remaining solution is allowed to cool, and is then diluted, first with a little cold, then with hot water, and H_2S is passed into the hot solution for a few moments. The exact time has not been determined, but will depend on the contents of silver and the flow of the gas. The idea is to precipitate just enough sulphide of copper to insure the complete precipitation of the silver, and at the same time to collect the very fine undissolved gold. If any of the latter is in solution, the precipitated sulphide of copper will react upon it and render it insoluble. The precipitated sulphides of silver and copper are coarse and flocculent, and settle almost immediately. The fine gold is readily collected by these sulphides, and the solution can be filtered in a very short time. The precipitate is dried on the filter paper, which is then ignited very gently in a scorifier in front of the muffle and scorified in the usual way.

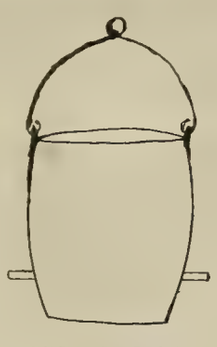
The filtrate obtained from the above precipitation can be tested for silver with a pinch of salt or a drop of Hcl, or this may be added at the time H_2S is passed into the solution.

The object of all partially wet methods for the assay of gold and silver in the presence of copper is to remove the latter, to avoid the otherwise heavy losses in cupellation. It may be objected to the method here proposed that, after attempting to remove the copper, it again mixes a certain quantity of that metal with the gold and silver. It is evident, however, that the quantity of copper thus added to the gold and silver can be so regulated as to be insignificant in amount, and in no wise to affect the accuracy of the assay.



The advantages of this method seem to the writer to be of considerable importance. The reagents used need not be chemically pure; the time required is but little more than that needed for an ordinary assay; and less care and skill are necessary for the determination than other methods demand.

* Transactions of the American Institute of Mining Engineers, Washington Meeting, February, 1900.



Self-Dumping Bucket for Incline Shaft.

TO THE EDITOR:—I enclose a sketch of a trip and self-dumping bucket I use on incline shafts. There is nothing new about it except the arrangement or placing of the small bolt at point of arrow, by placing it as shown in sketch and using 3 or 3½-inch strap iron, pointing one end as shown. You will not be bothered by trips sticking, as they usually do in cold weather, by freezing.

The square end of trip is always left a little longer than the pointed end to bring it back to a vertical position after letting bucket down, but by placing bolts as shown in sketch the lugs on bucket will force them to do their work under any reasonable circumstances.

Trip and Self-Dumping Bucket for Incline Shafts.

Self-Dumping Bucket.

I also show a rough sketch of the pattern of bucket used. I used one as described all last summer and it gave perfect satisfaction.

I would like to say also that in the ventilation of mines by a fan I have never found conditions such that would justify using a fan as a blower: by that I mean that the fan should be placed so that it sucks the air out of the mine instead of blowing it into it. If you suck the air out the fan has only to work against the size of pipe used; if you blow air in, the fan practically has to work against the size of shaft, or tunnel, as the occasion may be. These are conclusions I have come to by actual experience.

Spokane, Wash., March 15. MINER.

Two Curious Lakes of Nevada.

Written for the MINING AND SCIENTIFIC PRESS by H. W. FAIRBANKS.

In the heart of the Carson desert, about two miles east of Ragtown, there are two strange lakes whose waters are rich in soda.

The lakes occupy what are without doubt the shallow craters of extinct volcanoes. The gently undulating desert extends for miles in every direction and the presence of either craters or water would not be suspected if one were no more than a mile or two distant.

Driving through the soft, volcanic ashes which here cover the ground we ascend a gentle slope for a little distance and suddenly find ourselves on the brink of a shallow depression, perhaps 75 feet deep. In the center is a pond of yellowish water and around the margin are sheds containing piles of white, crystallized soda. This depression is not more than one-fourth of a mile across. (See engraving of Little Soda lake, first page.)

Continuing a little distance in a northeasterly direction the larger crater is soon seen. (See engraving of Soda lake, first page.) It is fully one mile across and more than 100 feet deep. It is occupied by a beautiful sheet of water, set in a rim as perfect and symmetrical as though it had been shaped by hand.

The water is shallow and intensely alkaline, although around the margin there are springs which are fit to drink. On the south side are the buildings of the company which is engaged in extracting soda from the waters. The usual method of separating the soda is employed. Ponds are made by raising embankments to separate portions of the water from the main body, and the water in them allowed to evaporate until the soda separates out as a thin layer over the bottom. At the time of my visit a new mill had just been put up for the purpose of refining the product before shipping it.

The great interest attaching to these lakes is their peculiar formation. Although the rims about the lakes are but slightly raised above the surrounding desert, the shape of the depressions is such as to make it clear that they were once the seat of explosive volcanic agency. No lava ever flowed from them, but over the surface of the region around there is a thick layer of fine ashes or pumice, while about the immediate rim there are most perfect specimens of volcanic bombs. Masses of liquid lava were hurled in the air and in many cases they were yet viscid when striking the ground, for grains of sand are imbedded in them.

Many craters of this kind occur to the westward about Mono lake, but nowhere, except in Oregon, do I know of any as large or as perfectly formed.

THE London Daily Mail says that since Johannesburg became the premier gold-producing field in the world the Americanization of the town and its surroundings is noticeable. Our veracious English contemporary declares that the Kaffirs talk with a strong New York intonation and "the casual talk of the mines is redolent of California rather than of Cornwall. The shops are full of the latest and best American machinery, run by American experts and erected by some of the cleverest mechanicians in the world. The assayer hails from Grass Valley, the cyanide man has put in his time at the Alaska–Treadwell, the chlorination superintendent used to be a cow puncher, and the battery man is more at home in San Francisco than in Johannesburg. Owing to the tact and ready resources of the Californians, everything worked with the utmost smoothness."

MINING SUMMARY.

ALASKA

At Cape Nome all lines of supplies, except dogs, are reported plentiful. Lumber is $75 per M feet, 100 pounds, a single sack, of coal, costs $50. A letter from Cape Nome says: "Bonanza district has been left on as by grasshoppers, and now there is a grand rush for Kodsedagera. The big excitement is at Mill Creek, fifteen miles above Prince of Wales. York is attracting a big lot of attention, and good results are shown. Above Cape Rodney is the latest, called New El Dorado district. The trail is hot with people for this district. There will no doubt be a big stampede for Norton Creek, as $11 a pan is reported. Other creeks yield 10 and 15 cents at the surface. The beach is being worked with good results, and coarse gold at times shows up."

ARIZONA

GILA COUNTY.

At Globe the Old Dominion mine and mill have been closed down and 250 men discharged. Only twenty men have been retained to work on the Continental property, which was recently purchased by the Old Dominion for $70,000. Difficulty in getting coke is the reported cause of the temporary cessation of work.

A later report says: "Old Dominion ore is abundant and plant is in good shape. 125 men have been laid off. 125 men are now working. The smelter has no coke, but will resume when supply arrives."

The Kassor is now the only producing gold mine in Globe district. The Supt. is J. E. Davies.

GRAHAM COUNTY.

Mgr. Colquhoun reports that in the years from 1893 to 1899, inclusive, the production of the Arizona Copper Co. has risen from 1078 tons to 9081 tons. Taken in percentage, the production of 1899 represented 746.46 as compared with 100. Taking the profit of 1891 as 100, that of 1899 was 1551.8. Taking 1895, when things had begun to improve, the profit was 240. Taking the cost per ton of 1893 as 100, the cost of 1899 was 96.5. Taking the price per ton in 1891 as 100, the price in 1899 was 144.4, but taking the profit of 1893 as 100, the profit per ton in 1899 was 618.95. The pressure put on the works has had the effect of wearing them out more rapidly than they were prepared for, and the company is receiving $225,000 out of the revenue of 1900 and will retain $200,000 out of the revenue of the current year. A dividend for the year of $1.87 per share has been declared.

The Detroit Copper M. Co. at Morenci now employs nearly 500 men. The completed concentrating plant has a capacity of 500 tons daily. There are in place six 125 H. P. gasoline engines, which furnish the power to run the concentrators, crushers and furnaces. The matte is converted by a pneumatic process. The daily output is from twenty-eight to thirty-five tons of bar copper, 98 fine. The company proposes to build a railroad to Guthrie, on the Gila river, connecting with the Arizona & New Mexico Railway, nineteen miles in length.

CALIFORNIA.

AMADOR COUNTY.

(Special Correspondence.)—The Shenandoah M. Co., of San Francisco, T. J. Parsons, Pres., has an encouraging strike in the Easton mine, the south extension of the old Red Cloud, two miles north of Plymouth.

On the 200-foot station of the new incline, the south level, 100 feet in length, exposed a 16-foot vein. Of this, the hanging and foot-wall portions assayed from $6 per ton upwards. The incline was deepened to 375 feet, the vein leaving the incline below the 200-foot station. A 34-foot crosscut to the west (foot wall side) failed to show the vein, excepting a seam. Crosscutting from the incline, 8 feet east, 5 feet of good ore was discovered. Of this, the assay certificate of an averaged sample gives $57.88 per ton in free gold and 2% of sulphides assaying $218.30 per ton—$4.36 per ton of ore.

Plymouth, March 20.

At the Royal Consolidated mines, at Hobson, the shaft is down 940 feet, working on a large vein. Forty stamps are dropping and a site is being graded for eighty more.

CALAVERAS COUNTY.

Near Angels, the Big Bonanza mine, under the ownership of the Oriole M. & M. Co., has resumed operations. F. E. Dunlap is Mgr.

At Camp Seco, W. W. Cook is about to put a 10-stamp mill on his mine.

EL DORADO COUNTY.

(Special Correspondence.)—At the German mine mill and hoist are run by water, there being 320 feet fall at the former and 280 feet at the hoist. The mill has ten stamps, a vibratory amalgamator, and shaking table. Ten additional stamps will be put in this year. Forty tons are daily crushed. The ore comes from the 400 and 600 feet levels. A station is being cut at the 800 level. The ore runs from 2% to 6% sulphurets, and these are sent to Selby's. The ledge is from 1 to 15 feet in width. At the hoist the engineer's levers are at the collar of the shaft, instead of being near the engine, as in most cases. Ingeniously contrived speed indicators of "home manufacture" are attached to the mill water wheel and to the vibratory amalgamator. C. O. Richard is superintendent and president of the company, G. M. Thomas foreman, Jas. Liddicoat foreman of mill. About twenty-five men are employed.

The Union or old Springfield mine, three miles south of El Dorado, was formerly owned by Alvinza Hayward. Upon a diminution in its output he ordered the mine closed down, pumps to be pulled out and work to cease. It remained idle until three years ago, when Harpending, Williams and associates bought it. It has to pay the purchase price for itself and other claims, paid for all improvements and left a surplus for its owners. There are six rich shoots of ore already exposed in the company's property, and three of these as yet have hardly been touched. Besides the 10-stamp mill at first erected, a second 10-stamp mill is nearly completed in another location. The property is about to be surveyed and mapped, after which a general plan will be decided upon for an extensive development of the widely separated ore shoots and the intervening ground. It promises to be a large proposition. A. F. Harpending is superintendent, C. C. Cantrell mine foreman, W. Taylor foreman of the mill. About fifty men are employed.

The Larkin gold mine, Diamond Springs, has been worked about four years by the present company. The vein is 4 feet wide quartz, ribbon rock and slate intermingled. The entire ledge is run through the mill. There are ten stamps in the mill and two concentrators. The ore runs 1½% to concentrates, which are sent to Selby's. A cyanide plant is projected. From working tests already made Supt. Jacobs is satisfied the sulphurets can be treated successfully. Three tons of ore to the stamp are crushed each twenty four hours. At the hoisting works a single reel hoist is used, which will do the work to 1000 feet depth. The vertical shaft is 900 feet deep. A double set of boilers of 150 H. P. capacity furnish steam for all purposes. The engine for the stamps is 25 H. P. A small hoisting engine is rigged to run the Cornish pump, which raises water from the 200 foot level, it being forced to that level from below by jack head pump. C. H. Jacobs is superintendent, W. E. Jones mine foreman, F. Walker surface foreman. On the average thirty-five men are employed.

The Griffith Consolidated gold mine, one half mile from the Larkin, is idle since Jan. 1st. This property is equipped with the best of modern machinery and at one time gave promise of developing into a dividend payer, but the owners were disappointed in the returns and ceased work, with the shaft but 750 feet deep. There is here as complete an electric plant as can be found in the State, the company having its own electric power house on the Cosumnes river, five miles distant. Eight claims are consolidated in this property. The ledge is 10 feet wide, low grade. Only two of the claims, the Griffith and Royal, have been developed, or even prospected. The property is owned by a Scotch syndicate, who also own the Jumper mine in Tuolumne county. About seventy-five men were employed when the mine was running, with Jas. Richards superintendent.

The Ribbon Rock and Tin Cup mining claims are near the Larkin at Diamond Springs. They are being prospected by E. A. Davis, who represents Alvinza Hayward. The latter has a bond on the claims. They are old locations, both on the same ledge, but little work has ever been done on either. Fifteen men are employed, J. H. Kelly foreman.

In the Big Canyon mine, five miles from Shingle Springs, the underground workings go down 745 feet, 200 feet vertical shaft, at the bottom of which a crosscut runs 70 feet to the ledge, where the second shaft is 545 feet deep. The hoist at the surface is run by water power and the air compressor is also direct connected to water wheels. The 30 stamp mill is run by water under 345 feet pressure, at the hoist the pressure is 305 feet. The ore runs 3% sulphurets, which are treated at the company's own chlorination works. Ninety tons of ore per day are put through the mill. Work was suspended last summer on account of scarcity of water, but operations were resumed Nov. 18th, '99. From forty to fifty men are employed, E. T. Kane superintendent, J. J. Kane foreman, Jesse Sell millman, Chas. Bowerman assayer.

At the Vandalia mines, one half mile from Big Canyon, the ore is worked dry in a 4 to 6 ton gravity jig, being too gummy to be run through a rotten mill; the ore is cyanided. It is so strongly acid that a percentage of lime (twenty lbs. to thirty pounds to the ton) is mixed with it before treatment. About thirty tons per day are now worked, but arrangements are completed to increase this to 100 tons. With a ledge 8 to 15 feet wide, prospected by three or four tunnels, there is a large reserve of ore blocked out. It can be stoped out from the tunnel levels to the surface. The motive power for the plant is supplied by two gasoline engines. C. E. Seymour and C. T. Shaver, the owners, have been operating the property two and one half years. They employ fifteen to twenty men.

The Crystal mine, near the Vandalia and Big Canyon, is handled by E. L. Simpson and Bowerman Bros. of Canyon. W. E. and Henry Klebsattel of Sacramento. This is an old mine, somewhat prospected. A tunnel 150 feet long runs into the side hill, tapping the ledge 100 feet below the surface. A shaft 170 feet deep on the ledge extends from this point. A new shoot has been struck from which ore will be taken for the mill. A 15 H. P. steam threshing engine furnishes motive power. The ore lately uncovered is expected to yield $15 per ton.

The Fisk is an old location near Placerville. Considerable has been taken out where the ore outcrops, and at other places the decomposed ore was sluiced off the sidehill with good results. A 5 stamp mill, run by water, has been started, and will work first the broken ore strewn along the hillside, later the levels will be developed by tunnels.

The Gentle Annie group of mines, one and one half miles north of Placerville, consists of five parallel gold bearing ledges, of which only the Gentle Annie ledge has been developed to any extent. Here there is a working shaft 400 feet deep, with 3000 to 4000 feet in drifts, and with upraises connecting different levels. But a small amount of stoping has been done, so that there are large reserves of rich ore. Proceeds from the same have largely paid for the development and plant. The latter consists in part of a hoist, run either by steam or compressed air ordinarily the latter, the air compressor located at a favorable point 3700 feet from the hoist, where there is a vertical fall of 442 feet. The water first does service at the mill, under 160 feet fall, before being used at the compressor. There is a cyanide plant for the sulphurets, of which the ore produces from 1% to 5%. On account of the death of one of the owners of the property work is temporarily suspended. H. J. Parlow, one of the partners, has charge of the property, A. L. McAfee engineer and machinist.

The Melton mine is on the south fork of the American river, two and one half miles from Placerville. The owner is dead. The property is in charge of an administrator. A company of miners has leased and is operating the mine and mill on a co-operative plan. The work proceeds with harmony and good effect. The ore, however, is low grade. The ledge is 30 feet wide, mineralized slate. A tunnel 700 feet long has been run into the side hill, whence the ore has been taken. Little stoping has been done. The 15 stamp mill and the air compressor are run by water power. The sidehill is so steep that the sulphurets are taken to a wagon by pack mules. J. H. Fuller is foreman, Al Philbrook and C. O. Forbes millmen.

Considerable is being done in the gravel deposits near Placerville. One extensive enterprise is that conducted by a company of which ex-State Senator Chapman of Placer county is the manager. This is a drift mine, two miles from Placerville. A tunnel 400 feet long runs into the gravel channel. The material is closely cemented and is fed from the dump into a Dodge crusher. The gold is caught in an amalgamator, on the aprons, and in the sluices below the mill. There is an ingenious arrangement for utilizing the waste water which splashes from the wheel. It accumulates in a tank and periodically sluices the boulders from the trough into which they are thrown by the crusher. About 100 tons of gravel are daily worked. Another tunnel will increase the output. Forty men are employed. Parker Bros. and Jos. Swansborough have charge.

The Stone gravel claim, adjoining, is leased to four miners, working on the co-operative plan. They take the gravel from a tunnel and put it through a regular 5 stamp mill.

At Kimble & Pike's gravel claim, adjacent, forty men are employed. There are two tunnels tapping the channel at points 500 feet apart. The cemented gravel is run through a 10 stamp mill, after which the pulp runs over silvered plates, then over 60 feet of riffles, and then into sluices. This is a profitable proposition, and at present rate of operations will last at least five years, as the company own seven eighths of a mile along an ancient river channel. The mill is run by water power. This claim is owned by Geo. W. Kimble of Placerville, who acts as superintendent, and D. H. Pike of San Francisco.

The Mountain Con. G. M. Co. is giving employment to nearly 100 men at its property in the northern part of El Dorado, near the North Fork of the American river, the boundary line between this and Placer county. Newcastle, Placer county, is the nearest railroad town, and the business of the mining company is largely done at that station. The mine was formerly known as the Zantgraff, an old location, and the only one of several owned by the company in its tract of 160 acres which has been developed. The ledge on the Zantgraff dips to the west at an angle of 16%. The walls are 4 feet apart, with 24 feet of solid quartz. The ore contains an unusual percentage of silver and last year the weight of silver recovered greatly exceeded that of the gold. Less than 1% of the ore in weight is contained in sulphurets, and these are shipped to Selby. The ore averages in value about $8 per ton. There are three other well defined ledges on the property, which have never been developed. The shaft is 1400 feet deep, the skips in which are run by electric hoist, with a steam hoist in reserve. The 25 stamp mill is also run by electric power, the company having its own power plant on the opposite side of the river, half a mile distant. The North Fork Ditch Co. supplies the water for this plant. With stamps weighing 1000 pounds each, 7 inch drop, 104 times per minute, and using 20 mesh screen, the mill reduces four tons of ore to the stamp, or 100 tons per day. Hand drilling is the practise in the mine, the company having no air compressor and no fans. It is, however, a well-ventilated mine, this result being largely accomplished through a drain tunnel which taps the ledge at the 300 level. E. Goodwin is superintendent, A. J. Blackburn foreman, Walter Humphreys shift boss, J. Walston millman, W. H. Hoag assayer.

Placerville, March 20.

FRESNO COUNTY.

The County Board of Supervisors will build a road to the copper mines of the Wabash and Copper King Companies.

NEVADA COUNTY.

(Special Correspondence.) Work conducted by the North Star Mines Co., Grass Valley, is on an extensive scale, and this continues to be one of the most interesting properties in the State. The work consists in the reopening of old and abandoned mines, and to the present point has demonstrated the correct judgment of the projectors now in charge. At the Blackbridge shaft, where the work of reopening began in 1896, and where much valuable ore has since been extracted, the shaft is now down to a depth of 1400 feet. Here sinking and drifting are constantly going on. At the North Star, where a depth of 2900 feet on the incline attained in former years has not been increased, a new shoot of ore has been uncovered by recent drifting, and this old property has taken on a new lease of life. At the Central North Star, where a vertical shaft was started in 1896 with the expectation of striking the New York Hill ledge at 650 feet, and the North Star ledge at 2000 feet or more, a depth of 1200 feet has been attained. At 645 feet the New York Hill ledge was cut, but drifting thereon has not been pushed to any great extent. Another ledge not the North Star has been cut recently, and this is reported to be quite rich. Sinking is going on as rapidly as possible. Within the past week a new pump with 30x18 inch cylinders has been installed, capable of throwing 600 gallons to the surface from a depth of 650 feet vertical. Smaller pumps do the work below that level. Power for the three shafts above named is generated at the compressor air plant on Wolf creek, distant from the Blackbridge 800 feet, from the Central shaft 1½ miles and from the North Star shaft about one mile. The air is reheated by use of petroleum as fuel, both at the Blackbridge and at the Central. At each of these shafts the compressed air is used for the hoists, pumps and power drills in the mines; at the North Star it is used only for power drills, the hoists, pumps and mills being run by water. There are two large compressors at the Wolf creek power house. One of these, the first put in, is run by a Pelton water wheel, 18 feet 6 inches in diameter, and requires 301 H. P. from the wheel, which is direct connected. The other compressor is of peculiar design and was originally run by water, but now by electricity. Water for the power house is brought 7070 feet in riveted steel pipe and delivered at the wheel under a head of 775 feet, or a static pressure of 335 pounds per square inch. As development progresses in the mines, constant additions are made to the already extensive plant of this company. It also adds frequently to its mining possessions

The Assay of Copper Materials for Gold and Silver.*

By L. D. GODSHALL, Spokane, Washington.

The extreme difficulty of obtaining a short and, at the same time, exact method for the determination of gold and silver in copper materials has been well illustrated in "Assays of Copper and Copper Matte," and its discussion by Dr. A. R. Ledoux and other leading authorities on this subject.

Two general methods were used by the numerous assayers who took part in the symposium initiated by Dr. Ledoux, and whose results are given in the paper and discussion. One of these is the dry, or fire method, consisting of scorification and cupellation, the former being repeated if the percentage of copper is very high, all slags and cupels being assayed, and the results so obtained added to the ordinary assay; and the copper retained by the silver buttons being determined and deducted from the combined weight of the buttons obtained from the assay of the original material, the scorification slag and the cupel.

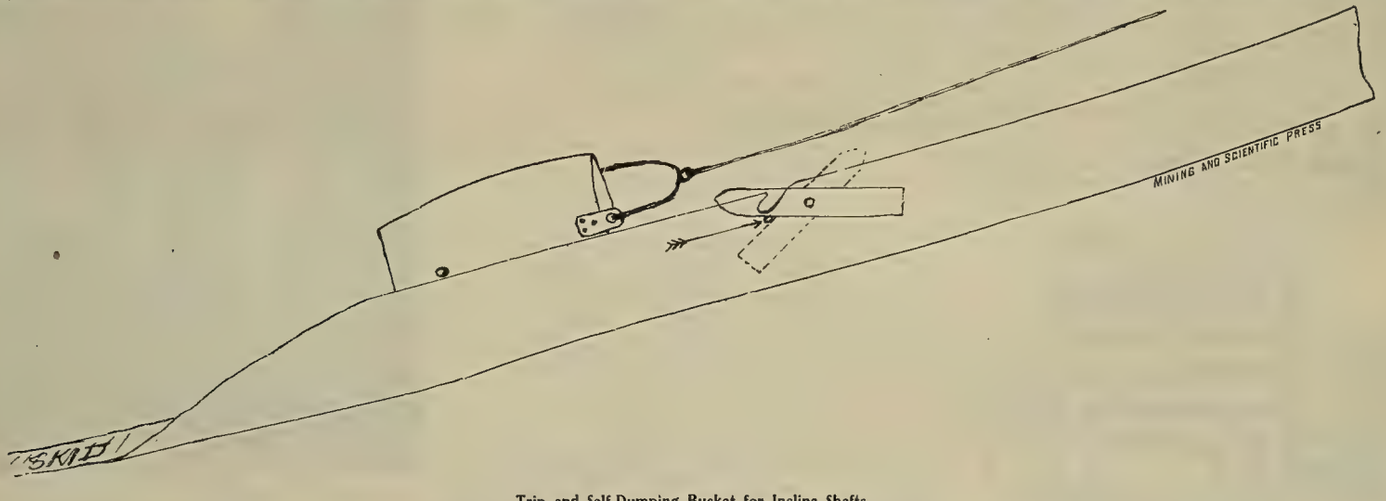
The other is the wet, or combination method, which, while not involving so much work, requires a longer time. Briefly, it is as follows: The material to be assayed is dissolved in nitric acid, the solution is diluted, and the fine undissolved gold is collected by means of sulphate of lead, formed by the addition of lead acetate and sulphuric acid to the solution. After standing from twelve to twenty-four hours, the precipitate is filtered off, and the silver in the filtrate is precipitated as a chloride or bromide and collected by means of sulphate or bromide of lead. The solution containing this precipitate in suspension is again allowed to stand until the precipitate has settled. It is then filtered; both precipitates, containing the gold and silver, are dried, ignited and scorified, either separately or together, and the result is cupelled in the usual way.

The above methods are open to several objections, the most important of which is the amount of work required for the one, and of time for the other. Moreover, the undissolved gold is naturally in an exceedingly fine state of division; the sulphate of lead, though heavy, is a fine precipitate, slow to filter, and, unless care is taken, liable to go through the filter paper. Again, in case any gold is dissolved, through impurities in the reagents, or from other causes, there are no means of detecting or saving it. In order to overcome these objections, the writer proposes to make use of two reactions, namely, the fractional precipitation by means of H_2S and the reaction between precipitated copper sulphide and a soluble salt of silver.

The method as proposed is, in brief, as follows: Take 0.5 to 4 A. T. of the material to be assayed (the quantity depending on the contents in gold and silver). Dissolve in dilute nitric acid, adding a small quantity of sulphuric acid at the same time. The latter is not absolutely necessary, but facilitates the subsequent removal of the excess of nitric acid. The nitric acid should be added in small quantities at a time, as required, to avoid too violent action and the use of a large excess. When the solution of the copper is complete, the excess of nitric acid is evaporated, and the remaining solution is allowed to cool, and is then diluted, first with a little cold, then with hot water, and H_2S is passed into the hot solution for a few moments. The exact time has not been determined, but will depend on the contents of silver and the flow of the gas. The idea is to precipitate just enough sulphide of copper to insure the complete precipitation of the silver, and at the same time to collect the very fine undissolved gold. If any of the latter is in solution, the precipitated sulphide of copper will react upon it and render it insoluble. The precipitated sulphides of silver and copper are coarse and flocculent, and settle almost immediately. The fine gold is readily collected by these sulphides, and the solution can be filtered in a very short time. The precipitate is dried on the filter paper, which is then ignited very gently in a scorifier in front of the muffle and scorified in the usual way.

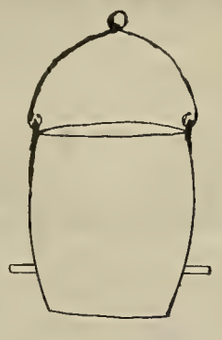
The filtrate obtained from the above precipitation can be tested for silver with a pinch of salt or a drop of Hcl, or this may be added at the time H_2S is passed into the solution.

The object of all partially wet methods for the assay of gold and silver in the presence of copper is to remove the latter, to avoid the otherwise heavy losses in cupellation. It may be objected to the method here proposed that, after attempting to remove the copper, it again mixes a certain quantity of that metal with the gold and silver. It is evident, however, that the quantity of copper thus added to the gold and silver can be so regulated as to be insignificant in amount, and in no wise to affect the accuracy of the assay.



The advantages of this method seem to the writer to be of considerable importance. The reagents used need not be chemically pure; the time required is but little more than that needed for an ordinary assay; and less care and skill are necessary for the determination than other methods demand.

* Transactions of the American Institute of Mining Engineers, Washington Meeting, February, 1900.



Self-Dumping Bucket for Incline Shaft.

TO THE EDITOR:—I enclose a sketch of a trip and self-dumping bucket I use on incline shafts. There is nothing new about it except the arrangement or placing of the small bolt at point of arrow, by placing it as shown in sketch and using 3 or 3½-inch strap iron, pointing one end as shown. You will not be bothered by trips sticking, as they usually do in cold weather, by freezing.

The square end of trip is always left a little longer than the pointed end to bring it back to a vertical position after letting bucket down, but by placing bolts as shown in sketch the lugs on bucket will force them to do their work under any reasonable circumstances.

Trip and Self-Dumping Bucket for Incline Shafts.

Self-Dumping Bucket.

I also show a rough sketch of the pattern of bucket used. I used one as described all last summer and it gave perfect satisfaction.

I would like to say also that in the ventilation of mines by a fan I have never found conditions such that would justify using a fan as a blower: by that I mean that the fan should be placed so that it sucks the air out of the mine instead of blowing it into it. If you suck the air out the fan has only to work against the size of pipe used; if you blow air in, the fan practically has to work against the size of shaft, or tunnel, as the occasion may be. These are conclusions I have come to by actual experience.

Spokane, Wash., March 15. MINER.

Two Curious Lakes of Nevada.

Written for the MINING AND SCIENTIFIC PRESS by H. W. FAIRBANKS.

In the heart of the Carson desert, about two miles east of Ragtown, there are two strange lakes whose waters are rich in soda.

The lakes occupy what are without doubt the shallow craters of extinct volcanoes. The gently undulating desert extends for miles in every direction and the presence of either craters or water would not be suspected if one were no more than a mile or two distant.

Driving through the soft, volcanic ashes which here cover the ground we ascend a gentle slope for a little distance and suddenly find ourselves on the brink of a shallow depression, perhaps 75 feet deep. In the center is a pond of yellowish water and around the margin are sheds containing piles of white, crystallized soda. This depression is not more than one-fourth of a mile across. (See engraving of Little Soda lake, first page.)

Continuing a little distance in a northeasterly direction the larger crater is soon seen. (See engraving of Soda lake, first page.) It is fully one mile across and more than 100 feet deep. It is occupied by a beautiful sheet of water, set in a rim as perfect and symmetrical as though it had been shaped by hand.

The water is shallow and intensely alkaline, although around the margin there are springs which are fit to drink. On the south side are the buildings of the company which is engaged in extracting soda from the waters. The usual method of separating the soda is employed. Ponds are made by raising embankments to separate portions of the water from the main body, and the water in them allowed to evaporate until the soda separates out as a thin layer over the bottom. At the time of my visit a new mill had just been put up for the purpose of refining the product before shipping it.

The great interest attaching to these lakes is their peculiar formation. Although the rims about the lakes are but slightly raised above the surrounding desert, the shape of the depressions is such as to make it clear that they were once the seat of explosive volcanic agency. No lava ever flowed from them, but over the surface of the region around there is a thick layer of fine ashes or pumice, while about the immediate rim there are most perfect specimens of volcanic bombs. Masses of liquid lava were hurled in the air and in many cases they were yet viscid when striking the ground, for grains of sand are imbedded in them.

Many craters of this kind occur to the westward about Mono lake, but nowhere, except in Oregon, do I know of any as large or as perfectly formed.

THE London Daily Mail says that since Johannesburg became the premier gold-producing field in the world the Americanization of the town and its surroundings is noticeable. Our veracious English contemporary declares that the Kaffirs talk with a strong New York intonation and "the casual talk of the mines is redolent of California rather than of Cornwall. The shops are full of the latest and best American machinery, run by American experts and erected by some of the cleverest mechanicians in the world. The assayer hails from Grass Valley, the cyanide man has put in his time at the Alaska–Treadwell, the chlorination superintendent used to be a cow puncher, and the battery man is more at home in San Francisco than in Johannesburg. Owing to the tact and ready resources of the Californians, everything worked with the utmost smoothness."

MINING SUMMARY.

ALASKA.

At Cape Nome all lines of supplies, except dogs, are reported plentiful. Lumber is $250 per M. feet; 100 pounds, a single sack, of coal, costs $50. A letter from Cape Nome says: "Bonanza district has been lit on as by grasshoppers, and now there is a grand rush for Koksadapagra. The big excitement is at Milk Creek, fifteen miles above Prince of Wales. York is attracting a big lot of attention, and good results are shown. Above Cape Rodney is the latest, called New El Dorado district. The trail is hot with people for this district. There will no doubt be a big stampede for Norton Creek, as $14 a pan is secured. Other creeks yield 10 and 15 cents at the surface. The beach is being worked with good results, and coarse gold at times shows up."

ARIZONA.

GILA COUNTY.

At Globe the Old Dominion mine and mill have been closed down and 230 men discharged. Only twenty men have been retained to work on the Continental property, which was recently purchased by the Old Dominion for $70,000. Difficulty in getting coke is the reported cause of the temporary cessation of work.

A later report says: "Old Dominion ore is abundant and plant is in good shape; 175 men have been laid off; 125 men are now working. The smelter has no coke, but will resume when supply arrives."

The Kasser is now the only producing gold mine in Globe district. The Supt. is J. E. Davies.

GRAHAM COUNTY.

Mgr. Colquhoun reports that in the years from 1893 to 1899, inclusive, the production of the Arizona Copper Co. has risen from 3928 tons to 9681 tons. Taken in percentage, the production of 1899 represented 246.46 as compared with 100. Taking the profit of 1893 as 100, that of 1899 was 1524.8. Taking 1895, when things had begun to improve, the profit was 249. Taking the cost per ton of 1893 as 100, the cost of 1899 was 96.5. Taking the price per ton in 1893 as 100, the price in 1899 was 144.4; but taking the profit of 1893 as 100, the profit per ton in 1899 was 618.95. The pressure put on the works has had the effect of wearing them out more rapidly than they were prepared for, and the company is reserving $225,000 out of the revenue of 1899 and will retain $200,000 out of the revenue of the current year. A dividend for the year of $1.87 per share has been declared.

The Detroit Copper M. Co. at Morenci now employs nearly 500 men. The completed concentrating plant has a capacity of 500 tons daily. There are in place six 125 H. P. gasoline engines, which furnish the power to run the concentrators, crushers and furnaces. The matte is converted by a pneumatic process. The daily output is from twenty-eight to thirty-five tons of bar copper, 98 fine. The company proposes to build a railroad to Guthrie, on the Gila river, connecting with the Arizona & New Mexico Railway, nineteen miles in length.

CALIFORNIA.

AMADOR COUNTY.

(Special Correspondence).—The Shenandoah M. Co., of San Francisco, T. J. Parsons, Pres., has an encouraging strike in the Easton mine, the south extension of the old Red Cloud, two miles north of Plymouth.

On the 200-foot station of the new incline, the south level, 100 feet in length, exposed a 16-foot vein. Of this, the hanging and foot wall portions assayed from $6 per ton upwards. The incline was deepened to 375 feet, the vein leaving the incline below the 200-foot station. A 34-foot crosscut to the west (foot wall side) failed to show the vein, excepting a seam. Crosscutting from the incline, 8 feet east, 5 feet of good ore was discovered. Of this, the assay certificate of an averaged sample gives $57.88 per ton in free gold and 2% of sulphides assaying $218.39 per ton= $4.36 per ton of ore.

Plymouth, March 20.

At the Royal Consolidated mines, at Hobson, the shaft is down 940 feet, working on a large vein. Forty stamps are dropping and a site is being graded for eighty more.

CALAVERAS COUNTY.

Near Angels, the Big Bonanza mine, under the ownership of the Oriole M. & M. Co., has resumed operations. F. E. Dunlap is Mgr.

At Campo Seco, W. W. Cook is about to put a 10-stamp mill on his mine.

EL DORADO COUNTY.

(Special Correspondence).—At the German mine mill and hoist are run by water, there being 320 feet fall at the former and 280 feet at the hoist. The mill has ten stamps, a vibratory amalgamator, and shaking table. Ten additional stamps will be put in this year. Forty tons are daily crushed. The ore comes from the 300 and 400-foot levels. A station is being cut at the 500 level. The ore runs from 2% to 6% sulphurets, and these are sent to Selby's. The ledge is from 3 to 15 feet in width. At the hoist the engineer's levers are at the collar of the shaft, instead of being near the engine, as in most cases. Ingeniously contrived speed indicators of "home manufacture" are attached to the mill water wheel and to the vibratory amalgamator. C. O. Richard is superintendent and president of the company, G. M. Thomas foreman, Jas. Liddicoat foreman of mill. About twenty-five men are employed.

The Union or old Springfield mine, three miles south of El Dorado, was formerly owned by Alvinza Hayward. Upon a diminution in its output he ordered the mine closed down, pumps to be pulled out and work to cease. It remained idle until three years ago, when Harpending, Williams and associates bought it. It has repaid the purchase price for itself and other claims, paid for all improvements and left a surplus for its owners. There are six rich shoots of ore already exposed in the company's property, and three of these as yet have hardly been touched. Besides the 10-stamp mill at first erected, a second 10-stamp mill is nearly completed in another location. The property is about to be surveyed and mapped, after which a general plan will be decided upon for an extensive development of the widely separated ore shoots and the intervening ground. It promises to be a large proposition. A. P. Harpending is superintendent, C. C. Cantrell mine foreman, W. Taylor foreman of the mill. About fifty men are employed.

The Larkin gold mine, Diamond Springs, has been worked about four years by the present company. The vein is 4 feet wide—quartz, ribbon rock and slate intermingled. The entire ledge is run through the mill. There are ten stamps in the mill and two concentrators. The ore runs 1½% to concentrates, which are sent to Selby's. A cyanide plant is projected. From working tests already made Supt. Jacobs is satisfied the sulphurets can be treated successfully. Three tons of ore to the stamp are crushed each twenty-four hours. At the hoisting works a single reel hoist is used, which will do the work to 1000 feet depth. The vertical shaft is 600 feet deep. A double set of boilers of 150 H. P. capacity furnish steam for all purposes. The engine for the stamps is 25 H. P. A small hoisting engine is rigged to run the Cornish pump, which raises water from the 200-foot level, it being forced to that level from below by jackhead pump. G. B. Jacobs is superintendent, W. E. Jones mine foreman, F. Walker surface foreman. On the average thirty-five men are employed.

The Griffith Consolidated gold mine, one-half mile from the Larkin, is idle since Jan. 1st. This property is equipped with the best of modern machinery and at one time gave promise of developing into a dividend-payer, but its owners were disappointed in the returns and ceased work, with the shaft but 750 feet deep. There is here as complete an electric plant as can be found in the State, the company having its own electric power house on the Cosumnes river, five miles distant. Eight claims are consolidated in this property. The ledge is 10 feet wide, low grade. Only two of the claims, the Griffith and Royal, have been developed, or even prospected. The property is owned by a Scotch syndicate, who also own the Jumper mine in Tuolumne county. About seventy-five men were employed when the mine was running, with Jas. Richards superintendent.

The Ribbon Rock and Tin Cup mining claims are near the Larkin at Diamond Springs. They are being prospected by E. A. Davis, who represents Alvinza Hayward. The latter has a bond on the claims. They are old locations, both on the same ledge, but little work has ever been done on either. Fifteen men are employed, J. H. Kelly foreman.

In the Big Canyon mine, five miles from Shingle Springs, the underground workings go down 745 feet, 200 feet vertical shaft, at the bottom of which a crosscut runs 70 feet to the ledge, where the second shaft is 545 feet deep. The hoist at the surface is run by water power and the air compressor is also direct connected to water wheels. The 30-stamp mill is run by water under 345 feet pressure; at the hoist the pressure is 365 feet. The ore runs 3% sulphurets, which are treated at the company's own chlorination works. Ninety tons of ore per day are put through the mill. Work was suspended last summer on account of scarcity of water, but operations were resumed Nov. 18th, '99. From forty to fifty men are employed, E. T. Kane superintendent, J. J. Kane foreman, Jesse Sell millman, Chas. Boarman assayer.

At the Vandalia mine, one-half mile from Big Canyon, the ore is worked dry in a revolving grizzly, being too gummy to be run through a roller mill; the ore is cyanided. It is so strongly acid that a percentage of lime (twenty-five to thirty pounds to the ton) is mixed with it before treatment. About thirty tons per day are now worked, but arrangments are contemplated to increase this to 100 tons. With a ledge 8 to 12 feet wide, prospected by three or four tunnels, there is a large reserve of ore blocked out. It can be stoped out from the tunnel levels to the surface. The motive power for the plant is supplied by two gasoline engines. C. E. Seymour and C. T. Staver, the owners, have been operating the property two and one-half years. They employ fifteen to twenty men.

The Crystal mine, near the Vandalia and Big Canyon, is bonded by E. L. Simpson and Boarman Bros. of Canyon, W. E. and Henry Kleinsorge of Sacramento. This is an old mine, somewhat prospected. A tunnel 450 feet long runs into the sidehill, tapping the ledge 100 feet below the surface. A shaft 170 feet deep on the ledge extends from this point. A new shoot has been struck from which ore will be taken for the mill. A 15 H. P. steam threshing engine furnishes motive power. The ore lately uncovered is expected to yield $15 per ton.

The Fisk is an old location near Placerville. Considerable has been taken out where the ore outcrops, and at other places the decomposed ore was sluiced off the sidehill with good results. A 5-stamp mill, run by water, has been started, and will work first the broken ore strewn along the hillside; later the levels will be developed by tunnels.

The Gentle Annie group of mines, one and one-half miles north of Placerville, consists of five parallel gold-bearing ledges, of which only the Gentle Annie ledge has been developed to any extent. Here there is a working shaft 400 feet deep, with 3000 to 4000 feet in drifts, and with upraises connecting different levels. But a small amount of stoping has been done, so that there are large reserves of rich ore. Proceeds from the same have largely paid for the development and plant. The latter consists in part of a hoist, run either by steam or compressed air—ordinarily the latter, the air compressor located at a favorable point 3700 feet from the hoist, where there is a vertical fall of 442 feet. The water first does service at the mill, under 160 feet fall, before being used at the compressor. There is a cyanide plant for the sulphurets, of which the ore produces from 4% to 5%. On account of the death of one of the owners of the property work is temporarily suspended. B. J. Parlow, one of the partners, has charge of the property, A. L. McAfee engineer and machinist.

The Melton mine is on the south fork of the American river, two and one-half miles from Placerville. The owner is dead. The property is in charge of an administrator. A company of miners has leased and is operating the mine and mill on a co-operative plan. The work proceeds with harmony and good effect. The ore, however, is low grade. The ledge is 30 feet wide, mineralized slate. A tunnel 700 feet long has been run into the sidehill, whence the ore has been taken. Little stoping has been done. The 15-stamp mill and the air compressor are run by water power. The sidehill is so steep that the sulphurets are taken to a wagon by pack mules. J. H. Fuller is foreman, Al Philbrook and G. O. Forbes millmen.

Considerable is being done in the gravel deposits near Placerville. One extensive enterprise is that conducted by a company of which ex-State Senator Chapman of Placer county is the manager. His is a drift mine, two miles from Placerville. A tunnel 400 feet long runs into the gravel channel. The material is closely cemented and is fed from the dump into a Dodge crusher. The gold is caught in an amalgamator, on the aprons, and in the sluices below the mill. There is an ingenious arrangement for utilizing the waste water which splashes from the wheel. It accumulates in a tank and periodically sluices the boulders from the trough into which they are thrown by the crusher. About 100 tons of gravel are daily worked. Another tunnel will increase the output. Forty men are employed. Parker Bros. and Jos. Swansborough have charge.

The Stone gravel claim, adjoining, is leased to four miners, working on the co-operative plan. They take the gravel from a tunnel and put it through a regular 5-stamp mill.

At Kimble & Pike's gravel claim, adjacent, forty men are employed. There are two tunnels tapping the channel at points 500 feet apart. The cemented gravel is run through a 10-stamp mill, after which the pulp runs over silvered plates, then over 60 feet of riffles, and then into sluices. This is a profitable proposition, and at present rate of operations will last at least five years, as the company own seven-eighths of a mile along an ancient river channel. The mill is run by water power. This claim is owned by Geo. W. Kimble of Placerville, who acts as superintendent, and D. B. Pike of San Francisco.

The Montauk Con. G. M. Co. is giving employment to nearly 100 men at its property in the northern part of El Dorado, near the North Fork of the American river, the boundary line between this and Placer county. Newcastle, Placer county, is the nearest railroad town, and the business of the mining company is largely done at that station. This mine was formerly known as the Zantgraft, an old location, and the only one of several owned by the company in its tract of 160 acres which has been developed. The ledge on the Zantgraft dips to the west at an angle of 45%. The walls are 4 feet apart, with 2½ feet of solid quartz. The ore contains an unusual percentage of silver. Last year the weight of silver recovered greatly exceeded that of the gold. Less than 1% of the ore in weight is contained in sulphurets, and these are shipped to Selby. The ore averages in value about $8 per ton. There are three other well-defined ledges on the property, which have never been developed. The shaft is 1100 feet deep, the skips in which are run by electric hoist, with a steam hoist in reserve. The 25-stamp mill is also run by electric power, the company having its own power plant on the opposite side of the river, half a mile distant. The North Fork Ditch Co. supplies the water for this plant. With stamps weighing 1000 pounds each, 7-inch drop, 104 times per minute, and using 20-mesh screen, the mill reduces four tons of ore to the stamp, or 100 tons per day. Hand drilling is the practise in the mine, the company having no air compressor and no fans. It is, however, a well-ventilated mine, this result being largely accomplished through a drain tunnel which taps the ledge at the 300 level. E. Goodwin is superintendent, A. J. Blackburn foreman, Walter Humphreys shift boss, J. Ralston millman, W. B. Hoag assayer.

Placerville, March 20.

FRESNO COUNTY.

The County Board of Supervisors will build a road to the copper mines of the Wabash and Copper King Companies.

NEVADA COUNTY.

(Special Correspondence).—Work conducted by the North Star Mines Co., Grass Valley, is on an extensive scale, and this continues to be one of the most interesting properties in the State. The work consists in the reopening of old and abandoned mines, and to the present point has demonstrated the correct judgment of the projectors now in charge. At the Stockbridge shaft, where the work of reopening began in 1896, and where much valuable ore has since been extracted, the shaft is now down to a depth of 1400 feet. Here sinking and drifting are constantly going on. At the North Star, where a depth of 2800 feet on the incline attained in former years has not been increased, a new shoot of ore has been uncovered by recent drifting, and this old property has taken on a new lease of life. At the Central North Star, where a vertical shaft was started in 1896 with the expectation of striking the New York Hill ledge at 650 feet, and the North Star ledge at 2000 feet or more, a depth of 1200 feet has been attained. At 645 feet the New York Hill ledge was cut, but drifting thereon has not been pushed to any great extent. Another ledge—not the North Star—has been cut recently, and this is reported to be quite rich. Sinking is going on as rapidly as possible. Within the past week a new pump with 30x18-inch cylinders has been installed, capable of throwing 600 gallons to the surface from a depth of 650 feet vertical. Smaller pumps do the work below that level. Power for the three shafts above named is generated at the compressor air plant on Wolf creek, distant from the Stockbridge 800 feet, from the Central shaft 1½ miles and from the North Star shaft about one mile. The air is reheated by use of petroleum as fuel, both at the Stockbridge and at the Central. At each of these shafts the compressed air is used to run the hoists, pumps and power drills in the mine; at the North Star it is used only for power drills, the hoists, pumps and mills being run by water. There are two large compressors at the Wolf creek power house. One of these, the first put in, is run by a Pelton water wheel, 18 feet 6 inches in diameter, and requires 304 H. P. from the wheel, which is direct-connected. The other compressor is of peculiar design and was originally run by water, but now by electricity. Water for the power house is brought 7070 feet in riveted steel pipe and delivered at the wheel under a head of 775 feet, or a static pressure of 335 pounds per square inch. As development progresses in the mines, constant additions are made to the already extensive plant of this company. It also adds frequently to its mining posses-

sions, having recently purchased the Granite Hill property, joining the Stockbridge claim on the south. It is proposed to work into the latter ground from the Granite Hill shaft. Ore reduction for all these properties is accomplished at the 40-stamp North Star mill, which is well designed and complete. As before stated, this mill is run by water delivered at the wheel under 280 feet pressure. A steam plant, with large boiler capacity, is in reserve for use in case of emergency. The North Star Mines Co. is managed by J. D. Hague; A. DeWint Foote, M. Am. Soc. C. E., is Gen. Supt.; Ab. Hall, foreman at Stockbridge shaft; Wm. P. Martin, foreman at Central shaft; Thos. Marshall, accountant for the company.

The Grass Valley Exploration Co. owns the W. Y. O. D. and other claims on Ophir Hill, less than one mile from town. Vigorous management characterizes the workings at the mine and mill. Formerly the entire plant was run by steam. Something over one year ago an 80 H. P. electric motor was installed to run the Gates rock breaker, the twenty stamps and seven 4-foot Frue vanners. This power having proven satisfactory, an electric plant has just been put in to run the Cornish pump, but the steam attachments will be kept in reserve. This leaves only the hoist and air compressor now run by steam. A modern double-reel hoist is used, which raises ore cars of 1½ tons capacity to the landing, 50 feet above the collar of the shaft, where an attendant runs them to the mill or to the waste dump, as may be required. The mill adjoins the hoisting works, making short transmission for the ore. A Gates sulphuret saving plant, with fourteen tables, has been constructed below the mill during the past year, and this part of the work is conducted with great thoroughness. The incline shaft at the W. Y. O. D. is now down to a depth on the ledge of 1500 feet. The mine is extensively opened by drifts at various levels, and is now one of the most remunerative properties in the Grass Valley district. J. R. R. Nuttall of San Francisco and the Weissbein Bros. of Grass Valley are leading stockholders; Mark B. Kerr, Supt.; H. Pengelly, foreman.

One of the most conspicuous things about the well-planned works of the Empire mine, Grass Valley, is the immense headgear, 90 feet high, supporting the ore bins. Here 1½-ton self-dumping skips unload their contents of ore into a bin provided with grizzlies, and the coarser stuff goes through a No. 5 Gates rock breaker with a crushing capacity of forty tons per hour. This rock breaker weighs 29,000 pounds. The double-reel friction hoist, run by water, is a beautiful machine. The bins for waste and broken ore are on the same level. The waste is taken to a semicircular dump; the ore goes by elevated tramway about 200 feet to the mill, where it is reduced by forty stamps and sixteen concentrators run by electricity. Below the mill is a Gates sulphuret saver, neatly housed and constructed. All of the buildings at the Empire are of ample proportions and of solid construction. In their picturesqueness, if not beauty, they are exceptional. The Empire is proving a grand producer of late years, having redeveloped a new shoot, struck in one of the lower levels. The shaft is 2500 feet deep on the incline. About 135 men are employed. W. D. Bourn of San Francisco is owner; Geo. W. Starr, Gen. Mgr.

The Empire Co. is continuing development work at the Omaha group of mines, purchased about one year ago. This group consists of five locations, viz., the Omaha, Hopkins, Lone Jack, Homeward Bound and New Homeward Bound, embracing 3698 lineal feet of vein and a surface area of sixty acres. Quite extensive surface plants are in operation at the Omaha and at the Homeward Bound. At the former there is an equipment of twenty-eight stamps and eight Frue vanners, also a strong hoist and a Cornish mill, all run by water. Here sinking and drifting are constantly going on. At the Homeward Bound fifteen to twenty tributers are at work, the ore being reduced at the Omaha mill, one-half mile distant. An elevated tramway connects the two properties. The hoist and pump at the Homeward Bound are run by electricity. The plant consists of a 5000-volt synchronous motor, 225-volt generator, 30 H. P. motor for the pump and two motors of 22 H. P. each for the hoist. The Omaha was a great producer in former years, having yielded $2,000,000. Its richest shoots have been worked out, but it is thought new ore bodies will be discovered under the present plan of development, backed as it is by ample capital.

At the Allison Ranch mine, three miles south of Grass Valley, the incline shaft is now down to a depth of 1300 feet, equivalent to 825 feet vertical. When this mine was reopened, in 1896, a 250 H. P. air compressor was put in, which was at first run by water and steam power applied to the same shaft. Within the past few weeks a mate to this compressor has been installed, it having been found necessary to furnish more power on the drills in order to continue sinking. The compressors will be run by electric power. Compressed air is used to run the Reidler pump, which throws water from the 400 level to the surface, as well as for the smaller pumps stationed at lower levels. The hoist is run by water power. No preparations have been made for the erection of a stamp mill, but there is some excellent ore in the bins, taken out while doing development work. It is locally thought there are reserves of ore that can be drawn upon when the time is ripe for its extraction. About fifty men are given employment in development work, under the superintendence of Robert Robertson, formerly of Amador county.

The enterprise near Grass Valley which is at present attracting most attention is that of reopening the old mines on Union hill, two and one-half miles east of town. About one year ago, Eugene Creller, formerly Supt. Idaho mine, organized a company embracing as stockholders Capt. Thos. Mein, Hamilton Smith, Henry Perkins, Henning Jennings, Albert Beit, besides Weissbein Bros., C. E. Clinch and other local people. Work has since begun at the old Union Hill shaft. There are five claims included in the organization—the Union Hill, Morning Dew, Lucky, Cambridge and Greek — with seventy-three acres embraced in the patents. Water has been piped from the South Yuba ditch, giving a pressure of 485 feet at the mine. Pumps were started and the old shaft—380 feet deep—was unwatered and retimbered where necessary to a depth of 180 feet. From this level drifts had been run 500 feet in each direction by former workers. At this point there was delay in getting the Cornish pump previously ordered, and the mine was allowed to fill with water. On the 15th of February last the new pump had been installed and pumping began again. The mine is now being rapidly freed of water, as the Cornish pump, the largest in the county, with a capacity of 25 miners' inches, is drawing from the 180 level, and two steam pumps of smaller capacity are also at work. The hoist, a double-reel, geared machine, and the pump, are set upon solid cement foundations. The crown wheel of the latter is 14 feet in diameter. The head gear for the hoist is 86 feet high. The mines in this group have an interesting history, and considerable is expected of them. The old Union Hill yielded $147,000 during its last working year; it sold $7000 worth of bullion during its last month, and its ore for a year averaged $14.73 per ton. The ledge is from 3 to 4 feet wide. The mine ought to pay well when worked under modern conditions, provided the ledges to be developed hold up in value. The property is in good hands, and will be intelligently and systematically developed.

Extensive improvements are under way at the Brunswick mine, on Union hill. The Cornish pump had been running to its utmost capacity to keep the mine free of water, and on the 5th ult., a break occurred in the crown wheel, which stopped work. Negotiations were opened with the Justice M. Co., and the massive Cornish pump used by that corporation at Gold Hill, Nevada, was purchased. The work of installing this pump is now going forward. Excavations have been made and concrete foundations laid for the machinery from 8 to 16 feet deep. The pump will be run by an 8-foot water wheel, but there will be an electric motor that can be resorted to in case of shortage of water. The crown wheel of the Justice pump weighs eleven tons. The rocking beam is to be 33x25 inches; the king post 35x25 inches, and 13 feet high. The line of plunger pumps in the mine includes a 14-inch at 400 feet; 12-inch at 700 feet, and a 12-inch at 1000 feet, which latter is the depth of the shaft. The friction hoist, run by water, has been converted from single to double, and the old gallows frame has been replaced by one 48 feet high, set on concrete foundations 10 feet deep. The shaft has been enlarged from two to three compartments, and straightened from the 300 level beyond the point where the inclination changes from 45° to 65° (400 level). This latter work was accomplished before the late break and while the mill was kept in operation. The mill contains twenty stamps, run by an 80 H. P. electric dynamo, while another dynamo of the same capacity runs an air compressor. The Brunswick stockholders are mainly New York people. Chris Mallon is superintendent; H. L. Body, chief engineer; C. H. Conlon, foreman. About sixty men are employed. H. G. P.

Nevada City, March 20.

PLACER COUNTY.

At the Morning Star drift gravel mine, Iowa Hill, the Colfax Sentinel says the working tunnel is in over 4000 feet and is below the gravel channel. As the gravel is mined it is dropped into cars through chutes. A daily average of 100 cars of gravel are mined. The average monthly payroll is about $4500. The partly cemented gravel is crushed in a 10-stamp mill.

SAN BERNARDINO COUNTY.

At Gold mountain Capt. DeLamar will build next month a 40-stamp mill.

Part of the machinery for Col. Ewing's 20-stamp mill has been brought up the Colorado river opposite Cottonwood island by the steamer from Needles. Searchlight ores will be hauled twelve miles thereto.

SAN DIEGO COUNTY.

Mgr. A. J. Smith of the Gold Crown M. & M. Co., at Picacho, near Yuma, will build a mill.

SAN LUIS OBISPO COUNTY.

Oil is reported struck fifteen miles east of Arroyo Grande, at a depth of 500 feet, the first strike in that county. The well will produce ten barrels daily.

SANTA BARBARA COUNTY.

The Southern Pacific Oil Co. at Summerland has struck a 100-barrel gushing well, 150 feet from the shore, 353 feet in depth. The region was illustrated on page 288 of last week's issue. This is said to be the finest well yet struck in Summerland, and seems a practical demonstration of the theory that an oil field is covered by the waters of the Santa Barbara channel.

SHASTA COUNTY.

(Special Correspondence).—As foreshadowed in the MINING AND SCIENTIFIC PRESS, Feb. 10th, the Afterthought copper properties, near Redding, have again been taken up, under a new bond, by A. H. Tarbet, Wm. McDermot and others of Butte, Mont. The latter has arrived at the mine and work begins forthwith.

At the Black Spider mine the methods of work have been changed to the contract system. An ore body of good grade is reported uncovered at 95 feet depth.

Work progresses on preliminaries for a large electric power plant here by a San Francisco company composed of C. L. Fair, Knight & Heggarty, C. L. Brown and others. The capitalization is $400,000. Several sites are under consideration, both on Pitt and McCloud rivers, previously noted. This company bears no relation to the local company.

At Bully Hill work is moving energetically and with system on the projected smelting plant under the management of T. H. Oxnam.

Encouraging discoveries have been made on the Stowell properties, being developed by the Mountain Copper Co. Diamond drills are in use.

Redding, March 22.

SIERRA COUNTY.

Messenger: The Kenton mine, Alleghany, will soon resume operations.——Mgr. F. B. Hill of the Oriental mine, near Alleghany, will put in a new pump and resume sinking.——Mgr. Garnier at the Osceola, near Alleghany, intends to erect a mill on the property this spring.——Mgr. Harper of the Harper mine, at Forest, will put in a pump.——T. A. Carson has an option on the Ante-Up and Brush Creek mines, and goes East next month.

SISKIYOU COUNTY.

(Special Correspondence).—J. H. Rice and associates of Grand Rapids, Mich., have started a 400-foot tunnel on a 12-foot vein of ore near Henley.

H. Mattern of Ashland, Or., has bought several more claims on Printer gulch and is developing them.

The old Black Jack and Blue Gravel will start again.

The old Sterling mine on Hungry creek has been started up after lying idle seven years.

J. Downing has found a $1900 pocket on Ash creek, where $10,000 was taken out three years ago.

Hornbrook, March 20.

(Special Correspondence). — The Gold Run group of gold quartz veins, on Knownothing creek, was discovered in '86, and has been since then worked continuously, yielding comfortable dividends. This remarkable, high-grade property has but four owners (a family concern), of which one is general manager and two others run the 10-stamp mill. The three constitute the official department, which, if not ornamental, has been and is successful. A winze being sunk in the lower tunnel, on one of the three pay ore veins, is now 65 feet in depth on a 4-foot vein.

Yreka, March 19.

TUOLUMNE COUNTY.

(Special Correspondence). — Near Big Oak Flat the Lillian mine has a vein averaging 4 feet in free gold and sulphurets, averaging $8 per ton.

The North Star mine, on the opposite side of the Tuolumne river, has a 2-foot vein averaging the same. These two mines are operated by the Mohican M. & M. Co. Both are tunneling propositions.

This district is in need of an electric power plant. There is a natural dam in the river two and one-half miles above the mouth of the North Fork of the Tuolumne river, which would afford ample fall for the plant to be placed at the mouth of the North Fork. At the driest season there is never less than 1500 inches of water at this point, and power could also be obtained from the North Fork as well.

There would be a demand for power from the Big Oak Flat, Groveland, Buchanan and Carter mining districts. Power would need be transmitted but five miles to reach the farthest point of any one of the districts named.

Groveland, March 20.

COLORADO.

ARAPAHOE COUNTY.

Denver smelters propose enlargement because of increase of ore supply beyond present ability to handle it.

BOULDER COUNTY.

W. P. Gillingham, Mgr. San Blas mine and mill at Ward, is busy on custom ore and will sink the mine shaft 300 feet deeper.

At Eldora, in the Mogul tunnel about 2000 feet from the portal and 1000 feet from the surface, Supt. Gilfillin has a pay streak of sylvanite 8 inches thick, value about $700 per ton.

CLEAR CREEK COUNTY.

Montreal men have bought the Consolidated Stanley mine, near Idaho Springs. The consideration is understood to be over $1,000,000. C. A. Gehrmann is Mgr. and part owner.

The Silver Leaf mine, at Freeland, has been sold to Milwaukee men for $30,000. J. W. Boyd will manage the property.

The Rising Sun mine, at Empire, has been bought by the Rising Sun M. Co. for $22,000.

The Courier at Georgetown has samples of tin ore from Devil's Head mountain, Douglas county, and Jefferson county.

LAKE COUNTY.

The Resurrection mine, Leadville, is being examined on an option given to an English company for $3,000,000.

From Leadville is monthly shipped 4000 tons zinc ore concentrates to Germany via Galveston. The zinc by-product permits the profitable working of such mines as the Iron-Silver property, of which T. E. Schwartz is Mgr.

MINERAL COUNTY.

T. G. Saunders figures that at Creede in spite of the low price of silver it pays better to mine silver ore to-day with silver at 60 cents per ounce than it did eight years ago with silver at 90 cents.

MONTROSE COUNTY.

W. Wilson of Grand Junction tells the Miner of a surface uranium deposit in the northern part of the county. The ore is chalky in character, and, according to analysis at Golden, contains 29% uranium. He sent 1400 pounds of the ore to Denver, for which he got $1.25 per pound for the metal in the ore, receiving a little over $500.

OURAY COUNTY.

At Bear Creek, C. H. Nix proposes an electric plant to generate 20,000 H. P. and furnish light and power to mines about Ouray, light for the city of Ouray and motive power for the electric road which O. Mears proposes to construct to Ironton.

SAN JUAN COUNTY.

At Silverton the Silver Lake M. Co. has 225 men at work.

The Unity tunnel is 400 feet lower than any other local workings, the ore averaging $20 per ton; 200 tons of ore are put through the mill daily—about fifty tons of concentrates every twenty-four hours.

The San Juan M. & D. Co., a California concern, is operating on Hazelton mountain.

The Sultan Mountain S. & M. Co. has let a 200-foot contract on the crosscut tunnel to cut the King and Grand Turk veins.

SAN MIGUEL COUNTY.

At Ophir the San Juan G. M. Co. has its new cyanide plant at the Bessie in operation, daily treating 200 tons ore. It is 125 feet from the mouth of the Black Hawk tunnel, which will in time connect all the properties with the mill. A 2400-foot tram conveys the product to the mill. There are two solution tanks, 20 feet in diameter, 10 feet deep; six leaching tanks, 30x6 feet; two settling tanks, 15x10 feet; two sump tanks, 15 and 20 feet in diameter by 10 feet deep. A 100 H. P. electric motor furnishes power.

SUMMIT COUNTY.

The low-grade sulphide ores of Frisco district are to be treated. The plans are drafted for a matte furnace at Frisco with an initial capacity of 200 tons per day.

TELLER COUNTY.

J. Dern of Mercur, Utah, is reported to have control of the Union G. M. Co. of Cripple Creek. The deal is said to represent a cash consideration of over $300,000. Utah papers deny the truth of the report.

The Advance G. M., B. & L. Co. is lo-

cally credited with the purchase of the Golden Wedge, on Raven hill, for $35,000.

Cripple Creek reports that this season seven new or enlarged reduction plants will be ready to operate on ore from that district with a total capacity of 1320 tons. The list includes the Union Gold Extraction Co., chlorination, at Florence, daily capacity 250 tons; National Gold Extraction Co., cyanide, Florence, addition to present plant, 110 tons a day; Colorado & Philadelphia Reduction Co., chlorination, Colorado City, addition to present plant, 110 tons a day; Metallic Gold Extraction Co., cyanide, Florence, addition to present plant, 100 tons a day; Economic Gold Extraction Co., cyanide, Eclipse, 300 tons a day; Brodie mill, cyanide, Cripple Creek district, 50 tons a day; Tutt & Penrose mill, chlorination, Colorado City or Florence, daily capacity 400 tons.

IDAHO.

ELMORE COUNTY.

In the Bascom mining district, sixteen miles from Rocky Bar, on the South Boise river, a 10-stamp mill will be put on the Gold Lion property by J. A. Nicholson.

OWYHEE COUNTY.

Supt. Irwin, in charge of the tunnel company boring under old War Eagle mountain, four miles from Silver City, is reported by the Avalanche to have an extensive plant. The tunnel is in 750 feet and is pushed 9 feet every twenty-four hours. The formation is a blocky granite. Three eight-hour shifts are employed. The tunnel is 6x7x7½ feet in the clear. The car line is single track, 24-inch gauge, laid with twenty-pound rails. Alongside is a drain about 20x30 inches cut in the floor. The tunnel is designed to open and drain the old Chariot ledge, and will have a length of 6300 feet. It will cut the vein 2200 feet below the surface, 800 feet below the deepest workings.

NEVADA.

LINCOLN COUNTY.

(Special Correspondence). — The Mayday, at this place, twenty miles west of Pioche, is developing with a force of thirty men, preparing for silver and copper production. This was a heavy producer in earlier years. It belongs now to Bybee & Savier.

Bristol, March 15.

STOREY COUNTY.

The returns of the bullion product of the Consolidated California & Virginia mine for January and February, 1900, from low-grade ore crushed and concentrated at the Kinkead mill, are as follows:

Ore worked, 1002 tons. Selby Company's assay value of ore concentrates—gold, $4425.55; silver, at 129.29, $2160.95; total, $6586.50; bullion bar, $167.97; silver, at 129.29, $6.86; grand total, $6761.33.

Bullion yield, per ton—Gold, $4.58; silver, $2.16; total, $6.74.

Assay value per ton, per battery samples—Gold, $4.68; silver, $3.88; total, $8.56.

Yield per cent, per battery samples—Gold, $9.79; silver, $5.56; aggregate, $7.87.

Assay value of the ore per ton, shipping value—Gold, $5.86; silver, $4.88; total, $10.56.

The concentrates from the above ore, also one bullion bar gained from settlings, were shipped to the Selby Smelting & Lead Works for treatment.

Settlement — 562 sacks concentrates, gross weight, 39,730 lbs.; tare on sacks, 690; moisture, 991 lbs.; net weight, 38,739 lbs, equal to 19 tons and 739 lbs.

Contents of concentrates—Gold, $4425.55, equal to 214.086 ounces at $19.50 per ounce, or $4174.68; silver, $2160.40, or 1671.40 ounces, less 5%, or 8357 ounces 59⅝c per ounce, $946.74; total contents, $5121.42.

Value of bar of bullion—Gold, $167.97; silver, $2.92; total, $170.89, making total value, including contents of concentrates, of $5292.01, or $5.28 per ton of ore.

Expense — Comstock Tunnel royalty, $203.10; crushing and concentrating ore, $2129.25; railroad freight on concentrates, $197.64; railroad freight on empty sacks, $1.38; hauling, 50 cents; hauling concentrates, $14.99; Selby Company's working charges, $213.06; Selby Company's discount on bar, $1.58; total expenses, $2761.50, or $2.75 per ton of ore. Net proceeds in gold coin, $2530.81, or $2.52 actual net profit per ton of ore.

NEW MEXICO.

BERNALILLO COUNTY.

The power plant of the Cochiti G. M. Co. at Bland approaches completion. The flywheel is 20 feet; the shaft upon which it turns is nearly 2 feet in thickness, weighing 40,000 pounds. The boilers will be six in number, 18 feet long and 70 inches in diameter. F. W. Hart is Supt.

The present population of Bland and vicinity, including the Albemarle camp, is estimated to be 3000. In the mines, mills and lumber camps 1500 men are employed. The Cochiti G. M. Co. is locally credited with intention to have its 800 H. P. electric plant and its enlarged mill in operation by May 1st, and then begin to treat 300 tons of ore daily. By June 1st the Navajo Co. is to have its electric tramway of one mile and its new 350-ton mill under way: R. W. Woodbury of Denver paid $50,000 for the Iron King mine; the ore is to be treated at Woodbury.

SANTA FE COUNTY.

L. Lewisohn of New York has sold to the Santa Fe G. & C. M. Co. the Santa Fe group of copper mines in this county for $750,000. There are sixteen mines in the group.

OREGON.

BAKER COUNTY.

"A solid mountain" of nickel, going $30 to the ton, is reported found at Rye valley, twenty miles from Baker City.

UTAH.

BEAVER COUNTY.

(Special Correspondence).—Beaver Lake District: The Copper Mountain mine has a 200-foot shaft and has shipped a car of copper ore.

The Skylark tunnel is progressing and on the property is a fair showing of copper.

The O. K., patented, has a 240-foot shaft and is being further developed. This was bought years ago by A. G. Campbell of Salt Lake City. The O. K. Extension is also developing. It has a whim over a 90-foot shaft and consists of eleven claims.

The F. W. group of nine claims parallels the O. K. and has some development. It belongs to Kelley, Brock & Covert. A vein is exposed, showing 3 feet of copper sulphides.

A conservative estimate of the copper found in Beaver Lake prospects places it at an average of 8%.

Rocky District: This is four to five miles west of Milford. The Glasgow & Western Co. have twelve claims here, all patented, on which a ledge of great width has been exposed by an open cut. A number of shafts have been sunk. Several cars of ore have been shipped from the group to their smelter at Golconda, Nev. The last shipment is said to have run 34% copper, $8 gold and thirty-two ounces silver.

The Copper Ranch, owned by Murphy & Prebble, includes seventeen claims, on which a copper ledge is being developed. A crosscut is being run to cut the ledge at greater depth.

The Old Hickory, owned by Green & Austin of Kansas City, has been bonded. This property has shipped considerable copper ore.

The Apex belongs to John Forgia of Milford and has a 50-foot ledge, as shown by surface work.

The Maggie Williams, comprising four claims, belonging to W. D. Williams, has a copper cropping that is promising. A tunnel is being run to cut the ledge at greater depth.

Star District: This is a lead, silver and gold district, seven miles west of Milford. The Rebel group, belonging to Cullen & Ryan, in former years shipped many thousand dollars' worth of silver-lead ore. It is well developed.

The Old Hickory, south of the Rebel, owned by A. G. Campbell and others, comprises seven claims and has been bonded to Col. Altman and A. B. Lewis of Chicago. It is all patented ground, which in former years was a heavy producer of silver, lead and gold.

The Vicksburg group, owned by Tatum Bros. of Philadelphia, worked steadily during the seventies, at which time it operated a smelter on the ground.

The Foothills, owned by Angus Buchanan and Hays Cook, has a fair showing of development and ore.

The Copper King, belonging to Forgia Bros. of Milford, is being developed.

The Elephant mine, patented property, is said to have produced $250,000 in gold, silver and lead. Since 1885 it has been worked only by "chloriders."

The Mammoth is owned by M. Cullen of Salt Lake City. In the seventies it produced ore of the value of $200,000. It is worked now by leasers.

The Orphan Boy group is developed by several shafts and is running a tunnel 200 feet on the vein. About $17,000 was taken from the surface. It is owned by W. D. Williams of Milford.

The Burning Moscow belongs to Cullen & Barrett and has considerable development. The vein uncovered yields 60% lead and as high as 200 ounces silver.

The Star district is said to have produced $10,000,000 from 1870 to 1886.

The Cave mine, nine miles southeast of Milford, was one of the heavy producers in earlier days. The rich carbonates and chlorides of silver were found exposed in great caves. Lessees have of late years made good money out of the property.

The Rollins, in the Lincoln district, fourteen miles southeast of Milford, has a steam hoist and is preparing to resume work. It was a large producer in former years. The ores are silver, lead and gold.

There is some activity in the Antelope district, fifteen miles northeast from Milford. The Caterpillar group of four claims has been worked for six years, producing a good grade of copper. There is likewise good development on the Moody group, and Bostwick & Co. are opening a property in the same locality.

WASCOTT.

Milford, Utah, March 14.

(Special Correspondence).—The Imperial, an extension of the Horn Silver, will be developed under a new organization in which Eastern people have a large representation. The property takes in about 400 acres.

Frisco, March 16.

IRON COUNTY.

(Special Correspondence).—Detroit capitalists have purchased a controlling interest in the Ophir mine at this place. The Ophir M. & M. Co., holding title to the property, have an ample treasury fund for further development. The erection of a mill is one of the contemplated projects a few months later.

Stateline, March 15.

JUAB COUNTY.

(Special Correspondence).—The Swansea at Silver City is shipping from 1000 to 1500 tons of silver-lead ores per month to the smelters. It is a good fluxing ore, carrying considerable iron. Most of the production comes from the 750-foot level, although the workings extend to 850 feet depth. Considerable water is encountered here, requiring pumping.

Silver City, March 17.

(Special Correspondence). — The Sunbeam mine, near Silver City, was ordered closed down by the board of directors on the 16th inst., on account of the operations not being profitable. The proposition of sinking below water level will be considered later. Mgr. Buckbee has resigned.

Silver City, March 17.

TOOELE COUNTY.

(Special Correspondence). — The West Argent group of five claims is working through a 600-foot shaft and shipping 100 tons of ore per month to the smelters, averaging 40% lead and 40 ounces silver. A level is run at each 100-foot station, on each of which there is ore. It is estimated that they have 20,000 tons of medium-grade ore blocked out, and the intention is to erect a concentrating mill. Chiefly interested are J. F. Connor, J. A. Brown, J. W. Perrin, F. R. Ball and T. Jacobson.

Stockton, March 16.

(Special Correspondence).—The Overland Co., whose mine and mill are at Sunshine, have elected a new board of directors and authorized an issue of $150,000 in bonds to be sold, the proceeds to pay off the company's indebtedness, further develop the mine and enlarge the mill. The directors are James A. Simpson, Denman Blanchard, W. B. Ferguson, of Massachusetts, J. A. McDougall, A. L. Robinson, W. S. McCornick, G. A. Duncan, of Utah.

Mercur, March 18.

SALT LAKE COUNTY.

(Special Correspondence).—W. A. Fourness, M. E., of Salt Lake City, has prepared plans for a new smelter to be erected at that place, of 800 tons daily capacity. The formation of a company for this project is said to be complete.

WASATCH COUNTY.

(Special Correspondence).—W. H. Hackney and W. E. Vigus, of Salt Lake City, have located a group of claims near Soldier's Summit, on which is an extensive ledge of oil shale, showing by analysis 8% light and heavy naphtha, 2.5% light burning oil, 3% heavy burning oil, 14.1% paraffine oils, with residuum of 79.6%. They believe the paraffine properties in the shale justify development.

Soldier's Summit, March 19.

WASHINGTON.

FERRY COUNTY.

At Republic the Mountain Lion 20-stamp mill is ready for work. The cyanide process will be used. J. S. Wyatt is Mgr.

FOREIGN.

BRITISH COLUMBIA.

At Rossland the Miner says miners are leaving for Butte, Cripple Creek, Sumpter, the Cœur d'Alenes, Cape Nome and other points. They say they do not care to lose their time while waiting for an adjustment of the differences that have arisen. They could go to work elsewhere, and there would be no question of contracts, and they would be paid for a day's work when they had done one. S. Curtis, Minister of Mines, is there endeavoring to reconcile the mine owners and miners so as to bring the labor troubles to an end.

Personal.

J. F. LANG is Supt. Black Spider mine, near Keswick, Cal.

J. S. WILBUR is Supt. Gray Eagle mine, Gold Point, Sierra county, Cal.

W. W. MATHER of the Plumbago mine, Sierra county, Cal., is in San Francisco.

GEO. KISLINGBURY has returned from Honduras, C. A., to Shasta county, Cal.

W. R. BEALL, Supt. Cleveland Consolidated Mines, Ono, Cal., is in San Francisco.

W. A. FERGUSON goes as electrical engineer with the Moctezuma Copper Co., Nacosari, Sonora, Mexico.

H. B. UNDERHILL, Sec'y Selby Smelting & Lead Works, has returned to San Francisco from Honolulu.

WM. MCDERMOT of Butte, Montana, is in Redding, Cal., to start work on the Afterthought copper property.

J. T. MCCARTHY has been appointed Gen. Mgr. and Supt. Klondike, Cripple Creek & Galena M. Co., Victor, Colo.

F. A. C. PERRINE, formerly of Stanford, Cal., now at Trenton, N. J., has been elected Pres. Stanley Manufacturing Co., Pittsfield, Mass.

E. D. BOYLE, formerly Supt. Alta mine, Gold Hill, Nevada county, Cal., has resigned to take charge of the Franklin mine, Willow Valley, Nevada City, Cal.

STATE MINING INSPECTOR H. A. LEE of Colorado requires a $20,000 bond from the Paris Exposition Commission for the safe return of Colorado's collection of mineral specimens.

A. EKMAN leaves San Francisco for Paris next week, where, during the Exposition, he will have charge of California's State mining exhibit. His address will be 8, Place de l'Opera.

F. A. GOURLAY of Sierra county, Cal., and J. H. Cunard of Nevada county, Cal., sailed on the 23rd for eastern Chinese gold fields, where they will have charge of a hydraulic mine.

CHAS. C. DERBY, Supt. New Almaden quicksilver mine, New Almaden, Cal., goes to Korea on the 7th prox. to examine some mining property. Mr. Derby expects to be absent from California about six months.

Industrial Notes.

—A box car that cost $457.17 in 1898 now costs $583.25; a locomotive costing $11,756.92 in 1898 now costs $14,497.99.

—For the seven months from July 1st, '99, the Southern Pacific Co.'s total operating expenses were $23,957,842, and total earnings in excess of operating expenses $14,209,895.

—There were recently shipped hence 1000 tons of wire nails to China on one steamer and 990 tons to the same country on another steamer. Within thirty days 1470 tons of wire nails were shipped to Japan. In December 1117 tons of wire were shipped to Australia.

—During the year 1899, according to Treasury statistics, Mexico bought from the United States $29,213,627 of machinery, steel, iron and other metals, as follows:

Agricultural machinery	$7,642,942
Electric machinery	254,955
Copper manufactures	710,053
Zinc manufactures	2,553,685
Telegraph wire	214,633
Rails	1,721,743
Divers vehicles	366,342
Metals for manufactures, iron, steel, etc	15,652,919
Bicycles	96,355
Total	$29,213,621

Catalogues Received.

THE Edward P. Allis Co. of Milwaukee, Wis., has just issued a very complete and handsome catalogue of "Power Transmission Machinery," such as gears, pulleys, shafting, etc., which will be sent free on application.

CATALOGUE NO. 1 of the 1900 series, issued by the Risdon Iron Works, San Francisco, is devoted mainly to discussion and description of engines and boilers, embracing the latest in that line. The tables and specifications afford opportunity for determining from local conditions just what is needed. There is a detailed illustrated description of the Heine patent safety boiler with the names and addresses of many Pacific coast users of that boiler. The catalogue will be sent on application to any address.

OF the Fraser & Chalmers' series four are received this week, the 9th edition of No. 6, "The Comet Crusher;" 7th edition of No. 7, "Perforated Sheet Metal;" No. 54, "The Sederholm Boilers;" and 9th edition of No. 4, "Gold and Silver Mills," any or all of which will be sent upon re-

quest addressed to W. 12th St. and Washtenaw Ave., Chicago. The last named is an unusually complete treatise of over 250 pages, with illustrations and technical description of various processes and the machinery and apparatus considered to be best adapted thereto.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR WEEK ENDING MARCH 13, 1900.

645,074.—WRENCH—C. C. English, Hood River, Ogn.
645,168.—GAS BURNER—J. P. Farmer, Portland, Ogn.
645,356.—LEAD PENCIL—A. D. Foster, Oakland, Cal.
645,470.—WATER TOWER—H. H. Gorter, S. F.
645,228.—GRAIN CLEANER—J. M. Lasswell, San Miguel, Cal.
645,533.—CONCENTRATOR — J. Mauldin, Sacramento, Cal.
645,531.—EVAPORATOR—A. P. Merrill, S. F.
645,229.—TRAVELING TARGET — H. L. Moller, S. F.
645,213.—SASH LOCK—H. U. Prindle, Woodland, Cal.
645,536.—ENGINE FOR ROCK DRILLS—P. H. Reardon, S. F.
645,537.—HOSE COUPLING—P. H. Reardon, S. F.
645,300.—OFFICE INDICATOR—C. V. B. Reeder, San Jose, Cal.
645,188.—SEPARATOR — F. A. Rider, Vekal, Ariz.
645,132.—ROTARY ENGINE—M. J. Robinson, Los Angeles, Cal.
645,219.—BORING DRILL—C. S. Stafford, S. F.
645,221.—WATER WHEEL—S. J. Tutthill, S. F.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

REFRIGERATOR CAR.—John Zobrist, Hanford, Cal., assignor to the John Zobrist Refrigerator & Ventilator Co. of same place. No. 644,268. Dated Feb. 27, 1900. The object of this invention is to provide cars for the transportation of perishable fruits and like goods, and means for keeping them continually cooled. The car has vertically disposed ice chambers at opposite ends, hermetically closing doors in the roof through which ice may be lowered into the chambers. These chambers have open work walls surrounding the ice chamber, and an annular air passage exterior thereto. A second open or network wall outside of the air chamber serves to retain the body of salt which is packed into the space exterior to the network wall, and between it and an outer closed casing. A lining extends across the top of the car and from end to end, forming a passage between it and the roof, with a central opening communicating with the interior of the car, and openings at the ends communicating with the air passages surrounding the ice chamber. A passage is formed along the center of the floor of the car around and over which the boxes are packed and openings are made between the opposite ends of this passage and the lower ends of the refrigerator air chambers. Revoluble fans are so disposed that the air will be caused to circulate through the refrigerating chambers and thence through the bottom passage, and through the car by means of the passages formed by the piling of the boxes or packages of merchandise within the car.

SNATCH BLOCK.—Walter W. Bouse, Aberdeen, Wash. No. 644,729. Dated March 6, 1900. This invention relates to improvements in snatch blocks, and it consists in the novel construction of a shell formed of cast steel or forged plates, one side being made in two parts with a hinge portion. The hinge pin is located below the line of curvature of the pulley rim where it crosses the open space, and converging so as to form an essentially continuous curve at the lower part of the shell. The upper part is slotted and through the slot passes a latch, with means for connecting it with the opposite side when the block has been closed. The lower shell is rigid, with a hollow pin of large diameter upon which the sheave turns, and this pin is provided with a means for containing and gradually discharging the lubricant within the sheave. It is also so fitted as to lock the two sides of the shell together.

METALLIC LIFEBOATS.—Wm. S. Ray, San Francisco, Cal. No. 644,723. Dated March 6, 1900. This invention relates to improvements in the construction of life and similar boats. In the usual construction of metallic boats they are formed of a number of sheets of metal overlapped and riveted together to complete the sides, and these sheets are then secured to wooden keels and have wooden runners fixed to the top. In addition to this a number of ribs or braces are necessary to give the boat thus constructed the requisite stiffness. These parts fitting closely against the metal gather moisture, which tends to rust and eventually destroy it, besides preventing access for the purpose of painting, etc. In this invention the boat has the sides each formed of a continuous single sheet of shaped metal, and a keel and stem and stern post formed of a single piece of metal, to which the boat sides are secured, gunwales being formed of segmental strips secured upon the upper edges. Interior to the boat are air tanks following the interior curvature of the sides, and these serve as supports for the thwarts and transverse containing compartments which are formed underneath the thwarts. Air chambers are also formed in the ends of the boat, and the intermediate parts are all supported out of contact with the inner sides, and are all removably secured in place.

SELF-LEVELING GRAIN CLEANER.—J. M. Lasswell, of San Miguel, Cal. No. 645,228. Dated March 13, 1900. The object of this invention is to provide a means by which the cleaning apparatus of traveling harvesters may be kept level transversely, and at the proper inclination longitudinally without reference to the tilting of the machine as it passes over the ground. It consists of shafts extending transversely across the screens about midway between the ends, so that the screen is fulcrumed thereon to tilt longitudinally. A crank arm is journaled in the sides of the machine and connected with one end of the screens, and weights depending from the ends of the shaft act like a pendulum to swing the shaft and correspondingly tilt the screens so that they are kept level in that direction. A second weight is suspended, and is so connected with the screens as to be vertically slidable, in side bars so that the screens will also be leveled by the transverse swaying weight whenever the machine tilts to one side or the other.

TRAVELING TARGET.—H. L. Moller, San Francisco, Cal. No. 645,229. Dated March 13, 1900. This invention comprises an endless track or runway with changes of direction, gears adapted to travel upon the track and means by which they are propelled, and a means for engaging and disengaging the gears with the propelling devices; a target of any description carried upon the car, a protecting wall by which the gears themselves are concealed, while the target projects above the wall so as to be in view of the marksman at the shooting stand. The target is so supported that when it is struck it will fall, and guides are so arranged with relation to it that it will afterwards be restored by them to its normal position. Brushes are also located in the path of the target by which the previous marks upon it will be obliterated.

Commercial Paragraphs.

R. G. HANFORD of San Francisco has ordered a placer testing outfit from the Keystone Driller Co., for use at Rocklin, Cal.

THE factory of the Robins Conveying Belt Co. at Passaic, N. J., is now running at full capacity, giving greater facilities for the manufacture of its patent belt conveyors than the company has before enjoyed. The draughting room and general offices of the company have been installed in the north tower of the Park Row building, Nos. 13-21 Park Row, New York City. The two towers of this building comprise the twenty-seventh, twenty-eighth, twenty-ninth and thirtieth stories, consequently these are the highest offices in the world, the thirtieth story being 375 feet from the sidewalk. The Robins Conveying Belt Co. cordially invite their friends to visit their new offices, from which a remarkable view of Greater New York is obtained.

Recently Declared Mining Dividends.

Buffalo Hump M. Co., Idaho, 1%.	April	2
Gold Deposit M. Co., Colorado, $10,000	March	15
Arizona Copper Co., Arizona, $1.87 per share	March	3
Anaconda C. M. Co., Montana, $2 per share	April	30
Lillie G. M. Co., Colorado, $11,-367.18	April	1
Independence T. & M. Co., Colorado, 1 cent per share, $12,500.	April	12

Amalgamated Copper Co., 2%	April	30

Latest Market Reports.

SAN FRANCISCO, March 22, 1900.

SILVER—Per oz., Troy: London, 27¾d (standard ounce, 925 fine); New York, bar silver, 60c (1000 fine); San Francisco, 60c; Mexican dollars, 49c. Dow, Jones & Co. say: "The sale on the Exchange of 20,000 ounces of silver at 61, buyer 60, is thought to indicate an impending movement by the United Metal Selling Co. to advance silver to a much higher plane. This company now practically controls the entire export of silver from the United States, through its relations with the American Smelting & Refining Co., and has great influence in the London silver market."

COPPER.—New York: Lake, 1 to 3 casks, 16.50 cash; carload lots, 16; Electrolytic, 1 to 3 casks, 16.25; carload lots, 16.00; Casting, 1 to 3 casks, 16.25; carload lots, 16.00. San Francisco: 17⅛@18. Mill copper plates, 21½c; bars, 23½@25c. The British Admiralty last week bought 2,000,000 pounds copper for immediate delivery.

LEAD.—New York, $4.67½; St. Louis, $4.68; San Francisco, $4.85; pipe 7½, sheet 8¾, bar 6½c. London, Soft Spanish Lead, £16 10s=4.70c per lb.

SPELTER. — New York, $4.55; St. Louis, $4.55; San Francisco, ton lots, 6c; 100-lb lots, 6¾c.

ANTIMONY. — New York, 9½c; San Francisco, 1000-lb lots, 11c; 300 to 500 lbs., 12@14c; 100-lb lots, 15@18c.

BABBITT METAL.— San Francisco, No. 1, 10c.

PHOSPHORUS. — F. o. b. New York or Philadelphia, 50@55c ℔ lb.

SOLDER. — Half-and-half, 100-lb. lots, 22½c; San Francisco, Plumbers', 100-lb. lots, 19c.

IRON. — Pittsburg, American soft—pig—large lots—$25.25; Scotch, $26.50; San Francisco, bar, per lb., 3½c.

STEEL.—San Francisco, bar, 12c to 20c per lb.

QUICKSILVER. — New York, $51.25; London, £9 14s; San Francisco, local, $51.50 ℔ flask of 76½ lbs.; export, $47.50.

PLATINUM.— San Francisco, crude, $16 ℔ oz.; manufactured, $19.50@22.00

FERRO-MANGANESE. — San Francisco, ℔ ton, $30.

ZINC.—San Francisco, 6c; slab, 6½c; bar, 8c.

TIN.—New York, pig, $32; San Francisco, ton lots, 36c; 1000 lbs., 36½c; 500 lbs., 37c; less, 38c; bar tin, ℔ lb., 41½c.

CANDLES.—Granite 6s, 16 oz., 40s., 12c ℔ set; 14 oz., 40s., 11c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

FUSE.—Triple tape, $4.35 per 1000 feet; double tape, $3.70; single tape, $3.45; Hemp, $2.55; Cement No. 2, $3.70; Cement No. 1, $2.95.

OILS.—Linseed, strictly pure, boiled, bbl., 68c; cs., 73c; raw, bbl., 66c; cs., 71c. Deodorized Stove Gasoline, bulk, 16c; do., cs., 22c; 86° Gasoline, bulk, 21c; do., cs., 27c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 15½c; do., in cs., 21½c; Lard Oil, Extra Winter Strained, bbl., 60c; cs., 65c; No. 1 bbl., 47½c; cs., 52½c; Neatsfoot Oil, coopers' bbls., 60c; extra bbls., 55c; cs., 60c; No. 1 bbl., 52½c; cs., 57½c.

ASSAY LITHARGE.—San Francisco, 10c ℔ lb.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 40c to 50c.

NICKEL.—New York, 40@45c ℔ lb.

BISMUTH.—New York, ℔ lb., $1.80

50-lb lots; San Francisco, $2.50 to $3 ℔ lots.

TUNGSTEN.—New York, ℔ lb., 75c; San Francisco, 90c.

COAL. — San Francisco coast, yard prices: Wellington, $8; Seattle, $7; Coos Bay, $5; Southfield, $7.50. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.50; Scotch, $8; Cumberland, $9; Cannel, $9.50; Welsh Anthracite, $12.50; Rock Springs, $10.05; Colorado Anthracite, $14.50.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 33@35c ℔ lb.; carloads, 30@31c; in 10-lb. tins, 40c; sulphuric acid, 1¼c ℔ lb. 66° B; soda ash, $1.60 ℔ 100 lbs. 58%; hyposulphite of soda, 2¾@3c ℔ lb.; blue vitriol, 5½@6c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.00; sks, 95c ℔ 100 lbs.; chloride of lime, spot, $2.35@2.50; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

San Francisco Stock Board Sales.

SOME DEALERS SAY
COLUMBUS BUGGY CO.'S VEHICLES

Are too high in price to admit of as much profit as the cheaper grades usually handled by agricultural implement dealers. A cheap vehicle costs just as much freight from the East as a good one, thus you get but little value for your money after paying three profits and freight.
If Columbus Buggy Co.'s vehicles are not on sale in your vicinity please write to the

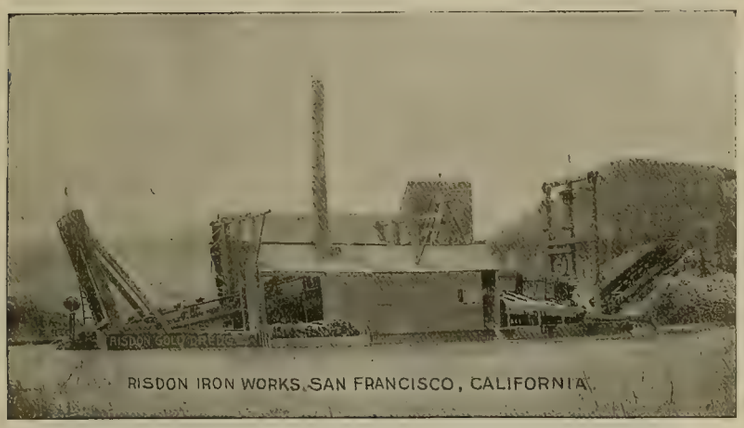
SMOOTH-ON CASTINGS.



An iron cement in powdered form, for repairing leaks or fractures in steam or hydraulic work, applied by mixing with water; hardens quickly and expands in hardening. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

MANUFACTURERS OF

Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines

OUR SPECIALTY.

We build **GOLD DREDGES COMPLETE IN RUNNING ORDER** to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.

We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.

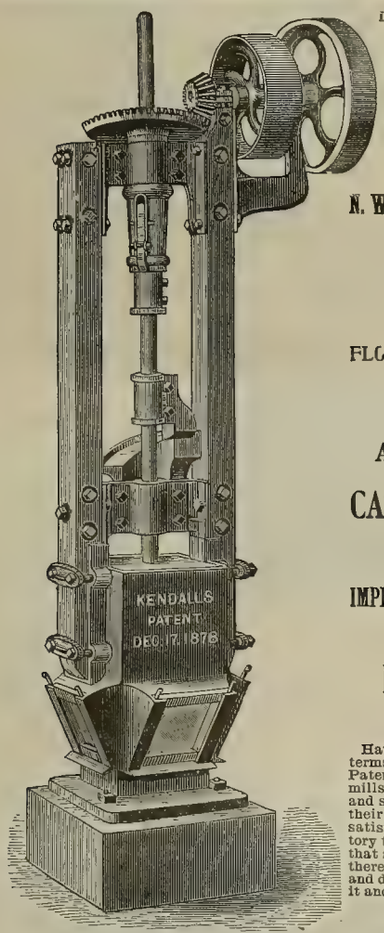
Send for Dredging Catalogue No. 17.

—WE ALSO BUILD—

All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

EVANS HYDRAULIC GRAVEL ELEVATORS.

We publish sixteen catalogues. Write for one in the line you are interested in.



THE RISDON HAMMERED SHOES AND DIES.

Manufactured from the best quality of projectile steel—which is stronger and tougher than any heretofore used—the best shoe and die ever made. Will crush more ore per pound of steel than any other. Will not chip or cup and will outcrush any other made. Wear smooth and true with hardly any perceptible decrease in their size, and those who use them say, "We never had shoes and dies wear so long." Send for circulars and dimension blanks to

"UNION" ENGINES Are in Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

Office, 314 Howard Street, San Francisco, Cal.

THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

NO. 2 LAMP.

McINTYRE'S DRY BATTERY

PORTABLE ELECTRIC SAFETY LAMP.

ABSOLUTE SAFETY is Assured All Users.

This is an Electric Lamp set in a White Enamel Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick-pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket. So the user has free use of hands. The current can be turned off when not in use. Dry batteries are used and can be recharged from direct Incandescent Electric Current. Charger and full directions go with each Lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Oil and Gas Works Employes, Powder Mills and Warehouses where explosive materials are manufactured and stored where it is impossible to carry an oil lamp or candle for fear of explosion, and all parties requiring a safe portable light. The whole outfit is neat and compact.

31 MAIN STREET, - - - - SAN FRANCISCO, CAL.

WHERE ONE OF THESE PUMPS IS IN PRACTICAL OPERATION.

SPADONE'S CONCENTRATOR BELTS.

PATENTED.

This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and ⅛ inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

M. S. HAUSER,

Room 39, 3 California St., San Francisco, Cal.

Will act as purchasing agent for mining companies.
Will use the benefit of his wide experience in getting the best articles at the lowest prices, securing low freight rates, and prompt delivery.
Will submit estimates on all kinds of supplies.
Will work for either a small salary or a commission, and show a saving greatly in excess of charges.

The "Stop for Repairs" to Mining Machinery,

Especially if it is a conveying plant, is a considerable item of expense. Many of these expensive pauses are made to repair or adjust faulty belting. To economize in this respect, use the

LEVIATHAN CONVEYOR BELT.

It is not only adapted to the heaviest service, but will run under any conditions in underground, drippings, extreme heat or cold.

IT WILL OUTLIVE ANY OTHER BELTING.

MAIN BELTING COMPANY,

1225-41 Carpenter Street, Philadelphia.
55-57 Market St., Chicago. 120 Pearl St., Boston.

THESE WAGONS ARE ESPECIALLY DESIGNED FOR STEAM FREIGHTING.

CAPACITY OF TRAIN, 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the world. Eighty of them in use on this Coast. They are being Successfully and Profitably Employed in Hauling Logs, Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend grades as much as 10% to 20%, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on a firm and moderately level road.

Send for descriptive Circulars and Price List of Engines and Wagons. We solicit correspondence. No trouble to answer questions.

The above illustration shows the method of holding and sighting BRUNTON'S PAT. POCKET MINE TRANSIT, when taking courses or horizontal angles. The construction is such as to permit of simultaneous sighting and reading. No tripod or Jacob's staff is necessary, and an operator, after becoming accustomed to its uses, can take the Transit from his pocket, take a reading and replace the instrument before a sighting compass can be placed. The most accurate and reliable pocket instrument on the market. Send for illustrated Catalogue B to

No. 1 Special Button Balance with 8-inch beam. Sensibility 1-200 Milligramme. For very accurate weighings. Among the well-known smelters using this balance are the following: GLOBE SMELTING & REFINING CO., Denver, Colo., U. S. A.; CANADIAN SMELTING WORKS, Trail, B. C.; MT. LYELL MINING & RAILWAY CO.'S Reduction Works, Penghana, Tasmania.

ASSESSMENT NOTICES.

OSCEOLA CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Plymouth, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of March, 1900, an assessment (No. 9) of one (1c) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 307 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of April, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

HOLLAND SMITH, Secretary.

Office—307 Montgomery street, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of March, 1900, an assessment (No. 11) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 773 Mission St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of May, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 26th day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California.

CONSOLIDATED CALIFORNIA AND VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of March, 1900, an assessment (No. 16) of twenty cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room No. 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of April, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 1st day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room No. 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

SOUTH PALOMA GOLD MINING COMPANY, Limited.—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of March, 1900, an assessment (No. 2) of six-tenths (6-10) of a cent per share was levied upon the capital stock of the corporation, payable immediately to the secretary, John F. Barnett, at Room 22, No. 222 Sansome St, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23rd day of April, 1900, will be delinquent and advertised for sale at public auction; and unless payment be made before, will be sold on MONDAY, the 14th day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

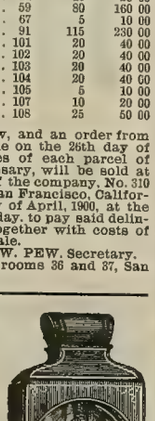
JOHN F. BARNETT, Secretary.

Office—Room 22, No. 222 Sansome St., San Francisco, California.

DELINQUENT SALE NOTICE.

CALIFORNIA BORAX COMPANY. — Location of principal place of business, San Francisco, California; location of works, San Bernardino County, California.

Notice —There are delinquent upon the following described stock, on account of assessment (No. 2) levied on the 26th day of January, 1900, the several amounts set opposite the names of the respective shareholders, as follows:



Name.	No. Cert.	No. Shares.	Amt.
Geo. H. Bradford	14	85	$170 00
Isaac W. Bradford	38	3	6 00
Clark C. Bradford	40	13	26 00
Annie M. Bradford	41	10	20 00
Geo. H. Bradford	59	80	160 00
H. P. Cartier	67	5	10 00
Geo. H. Bradford	91	115	230 00
Geo. H. Folsom	101	20	40 00
Geo. H. Folsom	102	20	40 00
Geo. H. Folsom	103	20	40 00
Geo. H. Folsom	104	20	40 00
Luther J. Holton, Trustee	105	5	10 00
Luther J. Holton, Trustee	107	10	20 00
F. E. Densmore	108	25	50 00

And in accordance with law, and an order from the Board of Directors, made on the 26th day of January, 1900, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the company, No. 310 Pine street, rooms 36 and 37, San Francisco, California, on MONDAY, the 2nd day of April, 1900, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. W. PEW, Secretary.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.**

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

RAWHIDE GOLD MINING COMPANY,
JAMESTOWN, TUOLUMNE CO., CAL., Feb. 21, 1897.

J. S. BROWNELL, ESQ.—DEAR SIR: Replying to your query of Feb. 15th, will say that I have used your Patent Lip flange belt more than one year, and judging from their appearance after more than one year of hard service, I do not hesitate to say that they are the best belt I have ever used and I take great pleasure in testifying to the fact. Yours truly, W. A. NEVILLS, President.

AMADOR CITY, CAL., Feb. 18, 1897.

MR. J. S. BROWNELL—DEAR SIR: I take pleasure in saying that I have used your Patent Lipped flange belt for several years while connected with this company, and I consider them the best that we have used. The quality of rubber in the flange seems to be the best, and we are not bothered with the flange cracking and thereby destroying the life of the belt. At present we are using 14 concentrators, and have in use several kinds of belts. We consider your Patent Lipped flange the best. Yours very truly, THE CONS. SOUTH SPRING HILL G. M. CO.
By JOHN R. TREGLOAN, Superintendent.

In connection with the present oil development in California, the status of the petroleum miner, what "scrip" is, oil titles, etc., become matters of moment to many. In next Saturday's issue—April 7th—this entire subject will receive authoritative notice. There is immediate need for intelligent information upon these matters, and every one interested in any way in oil will want such definite and reliable statement.

The U. S. Attorney General this week rendered an opinion in which he holds, in effect, that the time limit in the proviso in paragraph 181 of the tariff Act of July 24, 1897, which says that the refined metal produced from imported lead ores must be reexported, or the regular duties paid thereon, within six months of the date of the receipt of the ore, must be reckoned on the date the ore was received at the smelter, and not from the date the ore was received at the port of entry.

It is the generally accepted idea that increased demand for anything implies increased prices, and that an increased supply causes lower prices. But while this may seem locally, or momentarily, the case, yet in a broader way increased demand tends to decrease prices by creating enlarged markets, by occasioning more economical production and by directing attention to opportunity for profit with result of keen competition. The usual resultant is in open market that price of anything becomes the cost of production plus ordinary business profit. Where this is lacking a business dwindles or ceases. Wherever there is big profit competition is soon set up, for, with money at 3%, capital is soon attracted and it is this availability of capital that makes increased demand soon result in reduced prices.

The claims of an "ore vaporizing" company recently organized at Spokane, Wash., are of the absurd kind sometimes made by incorporators who, in ignorance or defiance of existing metallurgical requirements, publish fantastic theories as settled, indisputable facts. The concern "vaporizes" the ore at a heat of 3000° F., "recondenses" it, and "successfully treats refractory ore at a cost of $1 per ton." The oxygen and nitrogen in the air are separated "mechanically," the non-combustible nitrogen serves as a jacket to protect the furnace from the heat, etc., the usual "secret" process being in this case a mysterious steel cylinder, in which the "mechanical" separation of the oxygen and nitrogen takes place. To miners or metallurgists it is, of course, unnecessary to say that the scheme is impracticable. The projectors may be perfectly honest in their belief and intent, but sincerity of purpose unaccompanied by any commercial merit in a proposed plan is not wholly commendable from the investor's point of view.

The Hegira of 1900.

The Klondycitis of '97 is being repeated by those afflicted with the present form of Alaskamania, who are now rushing to Cape Nome. In the next sixty days it is probable that 50,000 men will leave Pacific coast ports, who will average $500 each for expenses, the rest to be charged up to experience. This $25,000,000 could be spent to better advantage developing a better mining country with better returns; but with the man determined to go to Cape Nome it were idle to dispute. He has the money to get there and is going, and that's all about it. Authentic facts have been published herein regarding the rich gold beaches of Cape Nome, illustrations from photos specially taken have been published in these columns, and accurate data given concerning that region, as is the province of a mining journal.

That wonderful gold finds have been made is undoubted fact, and great riches have already been won. The trouble or mistake is that the thousands rushing up there do not realize that the whole thing is already overdone; that everything procurable is already gobbled up; that there is now no chance in such a place for new comers or any one but men with capital or phenomenal skill; that luck plays little part, and that such a country (compared with which even the Klondike is a paradise) is fatal to any one not thoroughly acclimated.

The matter is referred to merely as a noticeable mining feature—the hegira of 1900—another manifestation of the great daring, the indomitable courage, the admirable spirit of undaunted energy that forever animates the American miner, pushing him on and on, farther to the frontier. One must admire the spirit, even though some manifestations of it are occasionally noticed with regret, as in this instance, where it is so clearly manifest that mistaken energy is hurrying many a deserving man to disappointment and death on that slender strip of shining sea coast as he follows the lure of Fortune's hope to the ends of the earth.

Unwise Mining Legislation.

Whether in Colorado, California or Canada, an attempt to make a pint cup hold a quart, or make one man as efficient as another by law, is the same blunder. The recent attempt in British Columbia to make an eight-hour law, creating a "legal day's work," has had the usual effect of such legislative meddling and muddling.

It is locally estimated that the stock valuation of the War Eagle mine in British Columbia was depreciated in a few days to the amount of $3,990,000, owing to the closing of the mine. The stock valuation of the Center Star suffered a shrinkage of $2,275,000 for the same reason. These mines were closed because of the labor troubles, occasioned solely and primarily by mischievous legislation: well-meant, good-intentioned, but none the less hurtful. Everything was going along all right; miners getting good wages, mine owners getting some profit on results, when the Provincial Legislature thought it would be a bright thing to make an eight-hour day the legal rule in British Columbia metal mines. The inevitable result followed, as detailed for some months past.

There is always need for judicious legal aid and helpful mining legislation, but in all cases a little sense is necessary on the part of the legislators. The miner himself has a good deal of common sense and readily understands whether a proposed measure will help or hurt the mining industry. Usually his condition is immediately affected by mining legislation and any attempt to change human nature by law is always unsuccessful. In general the fewer laws the better, so far as the miner is concerned.

Some time in the next century legislatures will learn that they might as well pass a law compelling everyone to work eight hours a day as to pass one making eight hours' work per day mandatory upon any particular class of workers. The one would be as likely of acquiescent observance as the other.

The most noticeable feature in present gold quartz mining operations in California is the continuous development of abandoned properties. Old mines, once profitable but long idle, are being profitably worked, the apparent idea being that it costs less to operate where former fortunes were taken out than to prospect new ground. Mining and scientific progress permits profit where formerly low-grade ores could only be worked at a loss, and the era of deep mining in California as compared to the old, vanishing day of surface richness has begun. Time was when nothing 250 feet below the surface was followed; now gold is being profitably mined in California from a depth of 2300 feet.

A Possible Contingency.

It was recently stated herein that in the event of defeat or the probable British siege of Pretoria, S. A., the Boers would essay destruction of Johannesburg and all the destroyable property pertaining to the Rand mines. A variety of editorial opinion has since been expressed as to the probability or unlikelihood of such action. A Houghton, Mich., report this week says:

Leading mine managers and engineers from the Transvaal who have visited the copper district since the beginning of the Boer war regard the destruction of mining plants in the Transvaal as highly probable. Mine managers are here to place orders for new equipment immediately after the destruction of the old machinery. One Johannesburg mine manager, now here, has full plans and specifications for a new plant which will cost about $1,000,000. Leading American machinery manufacturers have made conditional bids on probably $20,000,000 worth of new mining machinery for South African gold mines.

In war all things are possible, and the South African Republic Sampson may pull down the pillars of the Temple in an attempt to involve all in common ruin, so far as the immediate future is concerned. It is a tempting trump for Kruger to hold, and if, bereft of business reason, the Boers decide to wreck the machinery and blow up the mines, they are of that mold that brooks no restraint. He who has nothing to hope for has nothing to fear, and should the men who braved the British three times decide that in final defeat no mercy is to be shown, they may conclude to wreak as much havoc as possible before final surrender. If, on the contrary, the Boers hope for life and liberty under British domination, they will refrain from using their opportunity further than a menace to evoke better terms from their conquerors.

Explanation of Recent Land Office Ruling.

Comment was made in the issue of the 10th regarding an alleged U. S. Land Office ruling, that where a shaft costing $2500 was sunk on a group of five claims, that did not suffice, but that in such case $500 worth of work must be done on (not for) each claim. The case was reported from Utah. Register Blanchard of Salt Lake City says the report was misleading, and writes:

The ruling of the Commissioner of the General Land Office was in a case where the applicant sought to apply the work done on ground for which U. S. patent had been issued in 1875 as the $500 improvements on a lode claim of recent date and for which a separate application and entry had just been made. There was a time when the Land Office accepted such improvements upon patented ground, for later locations, as a sufficient compliance with the requirements that $500 worth of labor or improvements must be expended or made to enable the owner or owners to obtain U. S. patent, but this, AND THIS ONLY, is now affected by the new ruling. Where the work is done and the improvements made upon one claim of a group, the claims of the group consolidated, and the whole group embraced in one entry and application for patent, there is no change in the practise, and there is no doubt but what this work and improvements will hold the group and enable the applicants to obtain patent from the Government.

At Butte, Montana, another big mining suit is on this week, the litigation, as usual, being over the ever present question of apex and extralateral rights. This time it is the Colusa-Parrot M. & S. Co. vs. Anaconda Copper M. Co., and involves the ownership of the Anaconda vein. Plaintiffs charge defendant with entering the ground within the lines of the Parrot and Macawber lodes and extracting ore that is claimed to be part of the vein in Colusa-Parrot ground. Defendant admits having taken ore of the value of $5300, but asserts that it had a right to do so, claiming that it is working its own vein, which has its apex on the Anaconda lode. Plaintiffs assert that the Anaconda vein merges into their vein at the disputed point and that by reason of the Parrot being the older or prior location is entitled to claim the vein. Defendant denies this and says its vein does not join with the Parrot, but is distinct, separate and 150 feet north of the Parrot vein.

Concentrates.

CYANIDE'S proper place is rather in the leaching vats than in the battery mortar.

ALL professionals were once amateurs, and all good mines were once only prospects.

IT will take about 820 feet No. 23 wire, A. W. G., to give a resistance of seventeen ohms.

THE average value per ton of Australian ore treated is $14; $3 ore is treated at a profit in this country.

DIVIDENDS amounting to $37,275,750 have been paid by twenty-three mines in Utah to January 1, 1900.

ACCORDING to the mining laws of South Dakota, a working shaft 200 feet deep is required to operate a cage.

PYROMORPHITE is a phosphate of lead and is not unusual. It is found in the Bertha mine, Silver Cliff, Colo.

A SOLUTION containing a mixture of hydrocyanic acid and a carbonate or bicarbonate of alkali is a solvent for gold, if oxygen be present.

A SIPHON may aid in unwatering a shaft to a depth of 25 feet if conditions are favorable. With greater depth a pump or other appliance would be necessary.

ELECTRIC HEADLIGHTS are in use on some of the Southern Pacific Ry. Co.'s locomotives, and on some San Francisco street railways, with satisfactory result.

AT 50° F. sea level a cubic foot of air weighs 536 grains. At the Ft. Point battery, overlooking the San Francisco harbor, a cubic foot of air as there compressed weighs ten pounds.

THE watt output of the machine in question may be calculated by multiplying the voltage on open circuit by the amperage on closed circuit, and dividing the product by four.

THERE are many advantages claimed for wire screens and round-punched tin or sheet iron used in milling gold ores, the weight of practical evidence being apparently in favor of the latter.

TO PREPARE carbon paper for copying purposes, melt ten pounds lard, one part good wax, and mix with sufficient fine lampblack. Saturate unglazed paper with this; remove excess, and press.

IN nearly all copper blast furnaces from 40% to 60% of the sulphur in the charge is consumed in the blast, and the mattes are oxidized down to what may be termed a critical point, where they contain about 23% sulphur.

THIS PAPER is not responsible for the acts of any one who may make unauthorized claim to be its agent or representative. All its agents or representatives have credentials or authorization properly signed and dated.

SINCE January 1st the three different news companies handling the transient sales of this paper have each materially increased their weekly orders. Since Jan. 1st the names of 415 new subscribers in the one State of California have been received.

THE plural of dynamo may be spelled "dynamoes." It is one of the proudest prerogatives of an American citizen to spell any word as pleases his sovereign fancy, though making spelling entirely a matter of private judgment is not deemed wholly wise.

THE Columbia College School of Mines opened in '64, was the first school in the United States in which mining was taught as a science. There are several fine technical schools of mining now in independent operation or connected with a college or university.

IN Arizona in the present drought the gas engine will be able to demonstrate its utility in mining operations. Any kind of water will do, for it is only needed to cool the working cylinders; of this very little is required, and that little can be used till it evaporates.

LITTLE GOLD, but much silver, is produced in Bolivia, ores carrying 120 ounces or more of silver to the ton being shipped to Europe, lower grade ore crushed in local ball mills and subjected to a rude chlorination process, the net extraction being about 80% of the assay value.

IN common with other products, the cost of mining machinery has necessarily increased because of advanced prices for material, which in some cases is nearly double what it was two years ago, though recent advance in the price of the finished product is not more than 40% in any case.

THE California State Miners' Association has been in existence about eight years. It owes its existence to the faithful and unselfish efforts of earnest men and the liberality of its supporters. It has never had an "organ," nor has it ever authorized any one anywhere to represent it by any serial publication.

IT is difficult to get any record of old abandoned mines in California, and if there were such a law as suggested, requiring of every mine owner that surveys of all underground workings should be made and filed with a designated official, it would inure to the benefit of those engaged in opening up such old properties.

ALL modern inventions and discoveries are based upon new applications in the utilization of energy. Few new things are found out, and few new material combinations made. The closing century in science is most remarkable for discoveries, inventions, applications and utilizations of the various forms of what we term "energy."

MAGNESIUM has an electrical conductivity equal to 41.2% of that of pure copper. Alloyed with aluminum up to 10% of magnesium it increases the strength and elastic modulus of that metal, but greater additions yield a weak and brittle alloy. So far as known, all attempts to form an alloy of copper and magnesium have failed.

IN any gravel mining proposition the first thing to be determined is the pay value and nature of the gravel. Thorough prospecting, definite preliminary work, is first needed, then the opinion and advice of an experienced miner, then the investment in requisite ditch, pipes, flumes and machinery and intelligent supervision by a competent man.

TO MINERS the fact that a prospect, a claim or a location is an extension of or "adjacent" or "contiguous" to a producing property is not always a recommendation. Indeed, in some cases such "extensions" are notably deficient, as though Nature had exhausted her resources in that particular vicinage in filling the vein at the point where it proved so rich.

RUBBER can be fastened to smooth iron surfaces. Soften powdered shellac in ten times its weight of strong water of ammonia; a transparent mass results which becomes fluid after being kept a month. This, when applied, will soften rubber, which can thus be made to adhere closely to a smooth iron surface. The rubber hardens upon the evaporation of the ammonia.

THE typical Mexican smelting furnace, called "horno castellano," is a shaft in an adobe wall lined with stone, which will stand a high degree of heat. It is approximately square. It has a single tuyere, and the furnace is about 5.5 feet in height from the mouth to the tap hole. The bottom of the furnace has a slant forward. A shallow basin is scooped out in the earth in front of the tap hole, into which the molten metal is run.

TO SAY that a promoter is one "who sells nothing for something to a man who thinks he is getting something for nothing," while a smart saying, lacks accuracy or fairness. Quite often the promoter has a good thing for sale, and as frequently the buyer doesn't think he is "getting something for nothing," but does think, and rightly, too, that he is paying good money for something that, properly handled, may yield him a profit.

IN a steam engine the tangential pressure on the crank pin is equal to twice the total pressure on the piston, divided by 3.1416, because while the crank pin moves through 3.1416 diameters, the piston only moves through 2; hence, if the pressure on the piston is equal to 20,000 pounds, the tangential or mean pressure on the crank pin is equal to $\frac{20{,}000 \times 2}{3.1416} = 12{,}732$ pounds.

"THEORY" is of bad repute among many practical miners because of the gibberish and unintelligible language sometimes used by men who know nothing of the real work of mining and who pass for "theorists" among the men who do know and who do the work. The real "theorist" is the practical miner himself, who has intelligent theories born of comparison and experience, and who often makes of his theories valuable resultants.

THERE is considerable difference between a "miner" and a "prospector." A prospector is a good deal of a detective in practical mineralogy, watching every bit of float, deciding where it came from, noting country rock, formation, etc. A miner gives a good account of himself in timbering or getting out ore safely and cheaply, but notes little till he gets underground. Sometimes a good prospector is a good miner, and vice versa, but not as a rule.

IN California stamp mill practise stamps have been used weighing as much as 1400 pounds. Ordinarily the stamps weigh from 750 to 1000 pounds, have a speed of from eighty to ninety-six drops per minute, height of drop from 5 to 8 inches. In some parts of Colorado the stamps average 550 pounds in weight, have a drop of from 14 to 18 inches, and average about thirty drops per minute. These stamps are deemed in such action suitable to the ores they crush, the ores being more heavily sulphureted than those of California.

"DEVELOPMENT WORK" does not always develop, if it be shallow shaft sinking, running a lot of short tunnels, and, in general, "gophering." It often costs more to sink several shallow holes and run little drifts than one good shaft would, sunk deep enough to develop an ore body. While, of course, many a good prospect has been ruined by developing it, yet, if development be desired, the most usual better way is to concentrate the expenditure in one good shaft or tunnel rather than scatter. A rifle does better execution than a shotgun.

THE place to put your advertisement is in the paper read by those who want to buy your goods or your services. If you want to enlist the attention of sewing girls, tailors, butchers, farmers, sailors, etc., the dailies are doubtless good mediums. To get the attention of miners, results can be more cheaply secured by an advertisement in the paper that real miners read. The question for any advertiser is "Will the proposed advertisement bring me desired results?" Whatever will sell the thing advertised is good advertising.

A VOLUMETRIC method for lead analysis is as follows: Dissolve the substance to be analyzed in nitric acid, using a little hydrochloric acid, if necessary. When the decomposition is complete, add sulphuric acid and evaporate till white fumes of sulphuric anhydride are given off; dilute with water and cool; add to the liquid its own volume of common alcohol, and allow it to stand a short time. Filter and wash with hot water. Then wash the residue into about 50 c. c. of a cold saturated solution of ammonium carbonate with some of the carbonate solution. Stir frequently and vigorously for about fifteen minutes. Filter and wash both residue and filter very thoroughly with hot water. Dissolve the lead carbonate in hot dilute acetic acid. Cool and titrate with a solution of ferrocyanide of potassium.

A MINING CLAIM is a certain portion of a vein or lode and of the adjoining surface and subjacent material to which one or more have acquired possession by reason of compliance with federal, State and district rules, and carries with it the exclusive right and use of all the surface within the lines of location. The term mining ground is a much wider one, and may include a mine, or the interest of a mere occupant thereof, or, in a placer claim, the ditches, etc., in use therewith, or, in a quartz claim, all the veins or lodes having apex within its surface lines.

BY machine design is generally understood those calculations and drawings which are required for the production of efficient, economical and attractive looking tools and machines. This art demands such a combination of knowledge and skill as will insure a proper adjustment of strength to the work to be done, and such a distribution of the material employed and of the form into which it is put, that on the one hand there shall be no superfluous weight and consequent waste, and on the other no deficiency of material where material is needed. The machine designer begins where the inventor leaves off.

IN underground engines there is more wear and tear in the moving parts and cylinders, particularly when horizontal, than in surface—engines with longer strokes and a slower speed. Underground engines and pumps, being much smaller than surface engines and the pumps connected with them, must run at a much higher speed to get through the same amount of work, and the stroke being shorter a greater number of strokes is necessary. This leads to the valves of both the engine and the pump being operated a greater number of times, and causes considerably more wear and tear. This is considered one reason why long-stroke is preferred to short-stroke engines. Some of the movements of the valves of some pumps are so delicate that a slight obstruction will prevent their moving at all.

IRON and steel with a perfectly bright surface do not rust in absolutely pure water or air; carbonic acid or some similar agent must be present. Moisture, carbonic acid and oxygen being present, oxidation is not produced so long as vapor of water is not condensed upon the surface of the metal. In rusting, carbonate of iron is formed, which is dissolved in the water charged with carbonic acid and transformed into bicarbonate. In the presence of air, this is decomposed and gives magnetic oxide, then a hydrated oxide of iron. Polished iron and steel resist oxidation for a long time, but, once started, the rust forms rapidly and soon spreads over the entire surface. This is because the oxide of iron formed is electro-positive relatively to the iron, and is very hygroscopic, facilitating the absorption of moisture from the air. Steel and cast iron rust more easily than the purer metal; the more pure iron is, the more it is subject to oxidation. Phosphorus acts as a preserving agent. The alloys with nickel, cobalt and chromium are less readily rusted than common iron, while that with manganese is more so.

THE readers of the prospectuses of mining companies, of which there are at present no lack, are familiar with the phrase that "samples taken from the mine have been assayed by Messrs. So-and-So, and have yielded" so many ounces to the ton, as the case may be. While the name of the assayer is a guarantee that the samples submitted to him contained no more and no less than the amount certified, it is, however, in no sense a guarantee that the samples so tested represent the actual average value of the lode. This latter depends for its accuracy not only upon the sampler, the conditions under which the samples were taken, but also upon the quantity of the sample, and whether it was taken from a heap of ore already mined and accessible outside the mine, or from the lode itself as standing and exposed in the workings. The sampling of a heap of ore is of itself a difficult process, but with care and the exercise of patient skill, judgment, and supervision on behalf of the sampler, and the absence of interested parties, an approximately correct idea of its average mineral contents may be had.

STEAM ENGINES consume from twelve to fifty pounds of feed water and from one and one-quarter to seven pounds of coal per hour per indicated horse power. Condensing engines require from twenty to thirty times the amount of feed water for condensing purposes—approximately for most engines one to one and one-half gallons condensing water per minute per indicated horse power. Surface condensers for compound steam engines require about 2 square feet of cooling surface per horse power; ordinary engines will require more surface according to their economy in the use of steam. It is absolutely necessary that the air pump should be set lower than the condenser for satisfactory results. The effect of a good air pump and condenser should be to get 25 inches of vacuum and to make available about ten pounds more mean effective pressure with the same terminal pressure, or to give the same mean effective pressure with a correspondingly less terminal pressure. Approximately, a good condenser will save one-fourth of the fuel consumed, or, in other words, increase the power of the engine one-fourth, the fuel consumption remaining the same.

Copper Mining at Placeritas de Nacosari, Sonora, Mexico.

Written for the MINING AND SCIENTIFIC PRESS by H. B. LAYTON.

The colossal copper mining and milling enterprise of Phelps, Dodge & Co. of New York at and near Placeritas de Nacosari, Sonora, Mexico, ninety-eight miles south of Bisbee, Ariz., is nearly ready for operation. At a preliminary expense of approximately $3,000,000 gold, the owners of Bisbee, Globe and Morenci have opened up a new mineral country that will yield products of enormous value.

The work accomplished by the Moctezuma Copper Co., the corporate title of the Sonora enterprise, would, on paper, appear impossible; but it is practically complete; it is a reality, as the accompanying illustrations bear witness. Within a few weeks after this article is given to the public, the two five-ton vessels in the converting mill will be pouring copper 98% fine.

At the outset the natural question is: "What is the character and extent of the ore bodies that are deemed of sufficient value to justify a preliminary expense of more than $3,000,000 gold before a pound of product has yielded a cent of return?"

The answer in brief is: "A mountain of medium and low-grade sulphide ore." But a more specific explanation will interest the technical world, whose eyes are watching the progress of this giant undertaking and its general bearing upon the industry of mining, concentrating, smelting and converting.

The beginning of the history of the Moctezuma Copper Co. was capital and the nerve to spend it. The Guggenheims of New York might have arrived at the same results when they owned and operated the property. They had a 100-ton plant at old Nacosari that was fast becoming obsolete. The faithful but insufficient burro was the carrier between the five miles that separated mine and mill; fuel was far away and, therefore, costly. When they realized that only modern facilities could turn that mountain of ore into gold that would outweight the cost of getting it, they balked. Then they made overtures to the Phelps–Dodge people. Prof. James Douglas, who represents them as president of the companies that control Bisbee, Globe and Morenci, and Prof. A. H. Ricketts, whose success in mineralogy and metallurgy has brought him fame, examined the Pilares mine, a patented property with a surface area of 150 pertenencias. Their report was favorable, with the qualification that only by an enormous investment could the proposition be made to pay. This was easy to people whose joint income is not much—if any—below $10,000,000 per annum. Therefore, the Moctezuma Copper Co. was organized; the deal with the Guggenheims was closed on the lines, it is understood, of $1,000,000 for the property. A ranch of 12,000 acres, on which was perpetual water, a fine mill and townsite, was bought for $30,000; $1,000,000 was appropriated for the reduction plant, mine development, six miles of railroad between mine and mill and a town. Another million was appropriated for a 96-mile extension of the Arizona & Southeastern R. R. (a Phelps–Dodge enterprise, extending from Benson, on the Southern Pacific, fifty-five miles to Bisbee, with a three-mile spur near the latter point to Naco) from Naco to Placeritas de Nacosari, the new town where the mill is located. This amount will not complete and equip the road, but it is a good starter. Two years ago work was commenced. At that time the only structure on the townsite was a little 'dobe, that still stands as a landmark in front of the big company store and affords shade and shelter for a litter of motherless pigs that receive the benign protection of A. H. Danforth, the present resident superintendent.

The fact that skill and dollars were given to the work without stint was sufficient to soften but not to overcome the enormous difficulties that stood in the way of the successful accomplishment of the project.

Sixth Level Portal, Incline and Terminus of Railroad.

Nature had provided ore, rock for foundations, clay for brick and lime and sand for mortar, but nothing else. It was necessary to assemble tools, steel, machinery and all appliances from the mills, some of them thousands of miles away, and the last 100 miles a wagon haul over prairie and through canyon and gulch, over which stretch it was necessary to carry feed for man and beast. Freighting this 100 miles cost from $20 to $24 gold per ton. The freighting account alone aggregated upward of $100,000. One might ask: "Why was not the railroad built first and this money saved to construction account?" Time will probably answer and show that what was apparently a prodigality was really an economy and good business policy. Thus was the beginning. It is no wonder the native marveled more and more as the work progressed and developed. Did not Americans also marvel at the very audacity of the undertaking? For the first time the Mexicans saw long rows of dwellings made of burned brick; they failed to comprehend the philosophy of the power of the pulley, why one man could raise with it a weight of many tons. Finally came the locomotive in sections in wagons. When it was set up and in motion their astonishment was complete. They no longer doubted that whatever the Americanos wanted to do they would do, and that muy pronto. So the work progressed. Artisans whose skill had been tested in the service of the owners elsewhere were brought to the various departments, and it is probable that a more competent body of men were never assembled. The completeness and thoroughness of their work shows for itself.

A description of the various departments includes the mine, mine railroad, power plant, concentrate mill, furnaces, converting mill, and the respective accessories of each.

John Evans is superintendent of the mine, Daniel Huff surveyor and accountant. The Pilares mine was so named because of the presence of pillar-like rocks that project above the mountain and may be seen from adjacent hills many miles away. Its first level elevation is 5250 feet above sea level and 1250 feet above the mill. Topographically, the mountain is exceedingly steep on three sides, and on the east, at a point 150 feet below its apex, a ridge forms a connection with Joriquipa mountain.

Geologically, the first object of interest upon examination of the surface is that Pilares and the mountain immediately west are covered with breccia, with, perhaps, trachyte as the binder. This seems to be a capping on the hard bird's-eye porphyry that continues to as yet an undetermined depth. The ore deposit lies between these formations. The eruptive belt continues from here in a southeasterly direction and can be traced a distance of three miles by iron-stained cappings to the Joriquipa, where the Bell Union mine, owned by the same company, is located. Parallel to this belt and three miles to the west granite comes to the surface in Nacosari mountain and extends north through the Barragon and Porique mountains. It is apparent to geologists that a trachyte belt broke through the bird's-eye porphyry which formed the breccia-capped Pilares mountain. The ore body lies wholly within this trachyte belt.

The surface ore contains considerable black oxide of copper, but a sharp change occurs at a depth of 55 feet below the capping. Generally the ore is chalcopyrite, imbedded in siliceous rock. The constituents of the average grade as analyzed by Mr. Huff were found to be:

Silica	45.5
Alumina	24.82
Iron	8.5
Copper	8.0
Sulphur	12.25
Lime	.63
Magnesia	.30
	100.00

Flashlight Showing Stoping Begun in 1st Level.

Supt. Evans on extreme left; face of ore body at shoulder of man on right.

Trestle on Mine Railroad, 400 Ft. Long, 89 Ft. High.

Lower grade ore is merely a change of quantity of metal occurring in the gangue. The chemical constituents are not changed except in quantity, according to the ore. Thus it is a typical concentrating rock on account of the cleanliness and regularity of the mineral. In the three miles of development work so far completed estimates were made daily from samples. Results of assays are indicated on maps showing the positions of the ore bodies in the workings throughout the mine.

Little note has been taken of surface indications, although prospecting is being continued on the summit and ore is being taken out by contract. This ore can easily be sorted to 20%. It occurs in stringers 6 to 7 feet in width, outside of the regular ore body.

Development has progressed to the sixth level. Down to this point the ore body has been so well explored that it is known that nearly or quite 2,500,000 tons of available ore are in sight. Below that level the extent and character of the deposit are yet to be discovered. It has been demonstrated, however, that the copper value increases with depth. For example, Superintendent Evans says a good percentage of the rock in the second level is 10%, and that in the fourth level 800 feet of drift and two 75-foot crosscuts were all in 10% ore when the work was stopped by water.

The first level is a main tunnel 2000 feet long, extending through the mountain from southeast and curving to northwest. In the tunnel, 400 feet from the southeast portal, a radiating drift in the shape of a segment of an ellipse has been cut and returns to a junction with the tunnel 400 feet from

Flashlight Showing Two Compartments of Main Shaft on 3rd Level.

the northwest portal. The ore deposit in the first level or tunnel is 60 feet wide. No. 2 level is also a tunnel, which is intersected by a drift near the main shaft, and with crosscuts, all in ore. The third level is in 1000 feet, with six crosscuts, the longest 105 feet, all in ore. The fourth level has a drift 800 feet and two crosscuts of 75 feet each, all in ore, but water interferes with further work. The fifth level is a drift of 500 feet, with one crosscut of 60 feet, all in 10% ore. The entire body of this level is chalcopyrite mixed with a black sulphide.

Four hundred feet west of the first level tunnel is the three-compartment main shaft, each 4x4.5 feet, timbered every 5 feet from center to center with 8x8-inch and corner posts of same dimensions. Two steel safety cages are operated on the alternating system by a 25 H. P. gasoline engine, made by the Union Iron Works, with a capacity of raising one and one-half tons 165 feet per minute. The hoist is a double cylinder vertical type. The other cage is operated by a horizontal gasoline engine. Sinking the main shaft from the third level down to the sixth is in progress.

Northwest Side of Pilares Mountain, Showing Pillars, Looking West.

The sixth level is a 7x9-foot double-track tunnel, leading from Rosario canyon at grade of the railroad terminus at this point. It will tap the main shaft 5000 feet from the portal, and will require nearly another year to complete. Nearly 2900 feet have been made through the porphyry, and the ore body is but little farther in. The tunnel is under contract to Geo. Quackenbush for $13 per foot—powder, two machines, power, tools and light furnished. He pays labor $2 and drillers $4, Mexican, per day, and is making from 150 to 180 feet per month.

Until the tunnel meets the main shaft all ore from the second and third levels will be hoisted to the first level. The cars will be run by electricity through No. 1 tunnel to the opposite portal, and there the ore will be dumped into bins, whence it will be transferred to the railroad cars, which will be hauled 2000 feet to an inclined plane, upon which the cars will be transferred to the railroad grade below. The Porvenir or sixth level tunnel when completed will handle all the ore, and it will relieve the fourth and fifth levels of water. The ellipse-shaped auxiliary tunnel, No. 1 level, will be used by the returning empty cars. The functions of the inclined plane will be further described later.

Up to the present stoping has only been started in the first level, a section of which is illustrated. The system of stoping by filling, as inaugurated here, will be continued throughout the mine. In this level the ore is taken out and waste is filled in from the surface through winches in courses of 6 feet. The tunnels and drifts are timbered with 10x10-inch stuff. The sets are 6½ feet in the clear, 4⅝ feet from center. Ore chutes will be built along the mainways, with discharge vents at intervals of 50 feet, and an ample number of manways will be provided. Three winches have been carried from the surface down through all levels and now extend to the fifth. Through these waste will be conveniently run down by gravity and placed where desired. The timbers to be used, therefore, include tunnels and drifts, manways and ore chutes. Considering that timber costs approximately $140 to $150 (Mex.) per M. at the mine at the present time, the saving in employing the filling system will be a large item.

A sawmill has been installed on Porique mountain, thirty-five miles from the mine, but such of its product as can be secured is needed for other purposes.

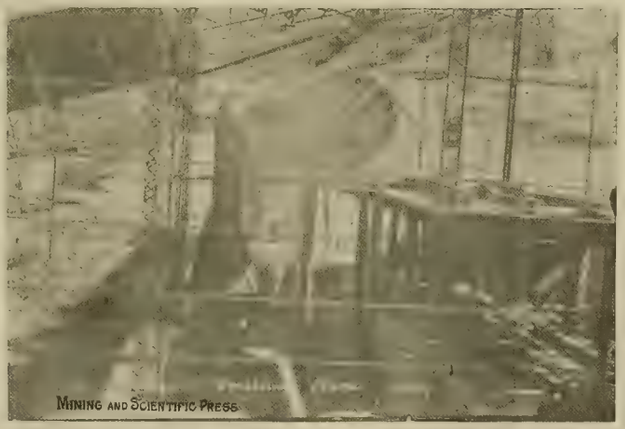
For completeness of work, precision of curves, permanency of fills, strength of trestling and perfection of alignment, the little mine road, J. W. D. Moodie, superintendent, is standard in everything save gauge. In the five and one-half miles of its length this 3-foot road rises more than 600 feet. It crosses canyons, cuts through mountain spurs and tunnels a divide. As a further evidence of the engineering skill required to secure uniformity of grade in consonance with the altitude to be gained, it need only be shown that the longest tangent is 800 feet, and they are few at that; the maximum radius of curves is 40°. Three trestles, one 400 feet long and 89 feet high, and a 400-foot curved tunnel were required. All curves are elevated to a speed of fifteen miles per hour, and from the mine down they are compensated to require for a loaded train the same power as for an empty train ascending. The slopes at all fills are faced with stone following the slope—in other words, practically walled. All cuts are through solid rock. The 40-lb. rails are all laid on tie plates. Mexican labor was employed and the task of getting intelligent work from them may be imagined. The cost averaged about $63,000 (Mex.) per mile.

Surface Workings Pilares Mine, Southeast Side.

Engine Leaving Tunnel on Mine Railroad Between Mill and Pilares Mine.

At the mine terminus at Porvenir, in Rosario canyon, is the base of the inclined plane that climbs to Pilares mountain. It is 1900 feet long on a 33% grade, with two trestles over gulches. The tracks are 3-foot gauge, with three rails from the foot to the turnouts and four rails from that point to the top. Being of gravity type, the loaded car carried by the skip in descending carries the empty car and skip to the top. The main cable and pulley wheels in the controlling station weigh twenty-one tons and are anchored in solid rock. The cable wheel is controlled by two steel friction bands with wooden brake shoes. The cable weighs 4000 pounds. The ore cars, of six tons capacity, are steel. They are run onto the incline skips, carried to the top, hauled to the ore bins, filled, returned and lowered to the railroad. With the exception of the ore that is hoisted from the second and third levels, the ore between mine and mill passes almost by gravity. It must be remembered at the same time that the hoisting of ore, its movement to the incline and the incline itself are all temporary arrangements, to be abandoned as soon as the sixth level tunnel is complete. Then all ore from upper levels will be lowered to the tunnel and dumped into the railroad cars. At present, "The General," a twenty-ton locomotive, does the work, but a thirty-ton consolidated is being placed on the tracks.

At the mill terminus a steel trestle extends from grade to the big steel ore bins at the concentrate mill. The track forms a loop near the mill. The loaded cars are dumped and when empty are continued around the loop to the main track.



Electricity is the motive power of the entire plant; W. A. Ferguson is electrician. The power house, 108x62 feet, is structural steel sheathed with corrugated iron. A twelve-ton traveling crane, with a 25-foot span, is available the entire length of the building. Eight gas engines, each 40,000 pounds weight complete, rated at 110 I. H. P., with a speed of 200 revolutions per minute, operate eight dynamos. Each engine has two hot tube lamps and outboard bearing that helps support the ten-ton flywheel. They are the regular four-cycle, hit-and-miss type. The gas system is a water gas process, a combination of water gas and hydrocarbon, made in a special apparatus similar to that now in practical operation at the Morenci works. The estimated saving is one-half the cost of steam. The water circulation for the engines is supplied from overhead tanks 20 feet above floor level.

Each engine is belted direct to a 65 K. W., 268-volt, shunt-wound, direct-current General Electric generator, speed 910 revolutions per minute. The current from the eight generators is carried to the switchboard by overhead cables. The switchboard comprises eight generator panels, one main station and one feeder panel. A novel feature of the board is the absence of any volt or ampere meters of the ordinary dial type. Instead, are 25-inch vertical glass tubes, containing a vermilion-colored fluid, in order that its exact altitude or position in the tube may be easily distinguished. The tubes rest against graduated scales, reading amperes and volts respectively. The liquid in the tubes is so controlled by an automatic air compressor that it conforms to and indicates the voltage and amperage generated by each dynamo. The reason for employing shunt-wound, instead of compound-wound, machines is that if any one of the engines should drop its speed below normal, the dynamo of that engine becomes for the time being a motor and does not interrupt the action of the others.

From the switchboard the current is transmitted to the various departments over four circuits of stranded conductor, each having an area of 500,000 miles. Two of these circuits are taken to two distributing boards in the concentrator, where each motor derives its current. The power allotted to this mill is 500 H. P., with additional overload capacity of 25%. Another set of feeders are carried to the smelter and converter blower house. Two 75 H. P. motors are belted direct to the converter high-pressure blowers; one 75 H. P. motor runs the blast furnace blower and a 50 H. P. motor operates the briquette machine, disintegrator and conveyor belt. Exhaust pipes from the gas engine cylinders convey underground the waste products of combustion to the drying room, where a 5 H. P. motor operates an exhaust fan that forces the heat through the room.

In addition, 400 16 C. P. incandescent and arc lamps, constant potential, will be distributed through the mills and the town. A 15 H. P. dynamo, run by a 16 H. P. gasoline engine, is installed at the mine and runs a 10 H. P. motor ventilator and six 15-inch Sturtevant blowers. Ultimately rotary and static transformers may be installed in the power house and transmitted to the mine to operate tramway motors, for lighting and other purposes.

Two large electric power pumps, in addition to the

Looking from Blower Room Into Smelter and Converter Plant, with Concentrator Beyond.

concentrator pump installed in a caisson sunk near the stream below the concentrator building 25 feet to bedrock, will furnish water for town and plant.

The concentrate plant of 400 tons daily capacity, erected and to be operated under the supervision of J. T. Hall, is practically complete. The entire building, 90x200 feet, in which 60,000 feet of masonry was used, is steel-framed and sheathed with corrugated iron. The motive power of the mill is electricity, brought from the central power station and accelerated through motors. A motor is provided for each distinct operative adjunct of the plant, as will be observed from the description that follows.

One noteworthy feature of this mill is that it is and, therefore, should be treated as twin mills of 200-ton capacity each. One mill may be entirely inactive while the other is in operation. Hence, but one of the twins, to avoid confusion, is here described.

The steel ore bin has a capacity of 1500 tons. From here the rock gravitates to a 10x20-inch crusher, operated by a 30 H. P. motor, and falls into a fifty-ton bin, whence it is fed automatically to an 8-foot revolving screen with a ⅝-inch mesh.

The rock that passes through the meshes of this screen drops to eight roughing jigs—four single and four two-compartment. The rock from these jigs passes to the first roughing rolls—a 16x36-inch machine, driven by a 50 H. P. motor. Thence it drops into an elevator boot and is carried up to a second set of two double trommels, the first ⅝-inch and ⅜-inch, respectively, and 16 feet trommel, and the second ½-inch and ¼-inch, respectively, and 16-foot trommel; thence it falls and passes through another set of four tiers, four, three and two four-compartment jigs. The tailings of the four two-compartment jigs are recrushed by 16x36-inch Gates rolls, driven by power from the motor that drives the roughing rolls, and the pulp from these is re-elevated to the trommels last mentioned. The tailings are then massed, and while passing through a straining trough to a narrow-faced, high-speed, 8x56-inch crushing rolls, run by a 50 H. P. motor, the water is withdrawn into settling tanks and is raised 25 feet to reservoir by two No. 6 Rumsey centrifugal pumps, driven by a 20 H. P. motor. This water supplies the roughing jigs. From the crushing rolls the tailings continue through two 16-mesh trommels, are sized to hydraulic dimensions, divided and passed through four four-compartment jigs and eight vanners. The tailings of these vanners are resized, the coarsest are rejected and the balance are passed over four vanners and run off.

Mill Plant and Town of Nacosari.

Black building on left is power house; white building next is machine shop; long brick structure adjacent is briquette dry room, briquette machine to stand at right. Beyond is masonry for coke bin, and the skeleton work near by is smelter and converter building; blow room is hidden by wall and fill at coke bin; ore bins, trestle and concentrator to the right; flue for fumes in foreground, town in background, Baragon mountain in the extreme distance.

The coarsest of the jig concentrates are taken by cars that run on tracks in alleyways between the jigs to the smelter. The finer concentrates are taken by the crane method to the briquette machine. The vanner concentrates and the concentrates from the lower fine jigs are collected and carried by an incline tramway also to the briquette machine. All the jigs, except the lower fine ones, are operated by a 30 H. P. motor. The lower jigs take their power from the vanner motor.

The water for the plant is pumped from a well near the stream and adjacent to the mill to a tank through an 8-inch pipe. The pump is a three-plunger, vertical driven by an independent 30 H. P. motor. The mill will consume 300,000 gallons of fresh water daily.

The mill in full operation with day and night shifts will employ a total of twenty-eight men. The wages to be paid will be at least equal to those paid in other States for similar service; 4% and 5% ore will be concentrated to a minimum of 26%.

From the concentrator the metal passes to a briquetting machine, where it is mixed with clay or lime, is pressed into disc-shaped briquettes, which proceed on cars to the drying chamber—100x8 feet—where they remain twenty-four hours, until hard, whence they are taken by tramway to the feed floor of the blast furnaces.

The smelter building is a steel structure, 175x62 feet, equipped with two 150-ton blast furnaces, two five-ton Bessemer converters, hydraulic pump and accumulators, a tilting matte settler, crushers and pans for grinding quartz used in lining converters, furnaces for drying furnace lining, turntables, hydraulic elevators and other equipment. The building is constructed with three floors of different heights, each projecting like steps beyond the other to permit the passing of all material by gravity through each successive process. Building and machinery rest on massive masonry to withstand weight and vibration. All dust and fumes originating in these departments are drawn into and carried off through a brick tunnel, 6½x8 feet, 800 feet long, to the top of the hill above the railroad, to a brick chimney, 250 feet above the mill. Immediately west of and adjoining the smelter building is the blow house, in which is the machinery described in connection with the power plant.

South of the smelter is the coke bin, 70x30x20 feet, enclosed by masonry walls supporting a roadway from which coke is delivered to the bin from wagons. Near the smelter also are the gas plant and coal storage bins.

Farther south are the machine and blacksmith shops, equipped with lathes, drilling presses, shapers, bolt cutters, pipe cutters and other machinery for repair work. Adjoining and 300 feet from the smelter is the power house, previously described.

North of the mill, across the little stream, is the town. Nearest the stream are fifty brick tenements in two long blocks. Across a plaza, 500 feet long by 140 feet wide, is the hotel, 260 feet long, and the store building, 264 feet long. Farther north are blocks of houses occupied by Dr. Giles H. Hall, company physician, J. W. D. Moodie and other heads of departments. Beyond these, at a higher elevation, is the structure reserved for offices of the company. A brick schoolhouse stands at the west end of the plaza, where a dozen Mexican children attend, an evidence that compulsory education is not the vogue in Mexico.

Upward of 100 skilled Americans are employed, and at present about 350 Mexicans. The latter receive from $1.50 to $2 per day, according to the work performed. The pay of the skilled men is the same as in other camps of the company in the States. When the mine and reduction departments are in complete running order employment will be given to 400 or 500 men in the former and perhaps 350 to 400 in the milling plant. Based on the population of the other camps controlled by the Phelps-Dodge Co., the total population of the camp, settlement and Nacosari town should be between 4000 and 5000 within a year and a half or two years. No ground can be bought anywhere near the company's camps, therefore the festive Yankee real estate agent will have no chance for a long time to come. Neither may independent stores be established on the company's property, nor in the town, until such time as the latter becomes an incorporated village according to Mexican laws, and those conditions are largely subject to the company's control.

Notwithstanding these facts, with the disbursement of at least $1000 per day gold to employes, the demand for provisions will be large, and farm and garden products will bring top prices. Already the ubiquitous Chinaman has caught on and is digging out patches of ground.

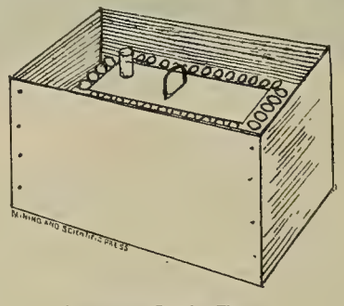
The policy of the company to do custom smelter work, together with the advent of the railroad, will prove an immense stimulant to mining in that section. Numerous copper locations and gold and silver properties now assume importance that, without smelter and transportation facilities, were of little value to their owners. I have taken note of the adjacent and tributary mineral-bearing districts and will describe them in a subsequent article.

From Naco, a new town on the international boundary, nine miles southwest of Bisbee, work on the extension of the Arizona & Southeastern is in progress. Forty-pound rails and ties sufficient for forty-five miles of railroad are stored there, and Streeter & Lusk, Chicago contractors, expect to complete this mileage by August. M. W. Wambaugh, C. E., is chief engineer for the company. The country for seventy-five miles permits easy grades and comparatively little heavy work. The route follows a broad valley nearly the entire distance. From there to Nacosari it is through an exceedingly heavy country, penetrable only through box canyons. The charter or concession for the railroad requires it to be built to a port on the Gulf of California. Ultimately, therefore, the line will reach either Guaymas or Mazatlan.

It is not expected that the present plant will be sufficient to handle the ore as fast as it may be produced when the mine has been further developed, and it is probable, therefore, that large additions will be erected.

Cariboo Hydraulic Mining Co.

J. B. Hobson, formerly of Placer county, Cal., now general manager of the Con. Cariboo Hydraulic Mining Co., Bullion, Cariboo district, British Columbia, sends an elaborate report of operations in the season of 1899, with maps, photographs, etc. Some of the photos have been grouped by our engravers in the picture on the front page depicting the workings of that property. The company's property comprises 2,904 acres on the south fork of the Quesnelle river, and covers two ancient river channels. It is one of the largest hydraulic mines in the world. During the season was expended a total of $194,520.51. During the 145 days' run there were used 353,056 miners' inches of water, there were removed 1,952,535 cubic yards gravel, sand, etc., and gold to the value of $92,678.93 was recovered. At the close of the season about 110,000 miners' inches of water remained in the reservoir. The total operating expenses of the company to date is $439,026.12. The total amount of gold recovered aggregates $528,000.



The auditor's report gives a detailed statement of expenses for 1899, among the items of which are: explosives, $38,837 02; labor, $39,068.42; transportation of miners, $4649.26; management, $6436.40; ditch maintenance, $12,174.05; slimes, $6422.11.

It is calculated that the material washed will average over 21 cents per cubic yard, and that it can be treated at a cost of a little over 6 cents per cubic yard. The expense of the last season was largely caused by construction work of a permanent nature, and Manager Hobson expects profitable results from the season of 1900.

An Inexpensive Powder Thawer.

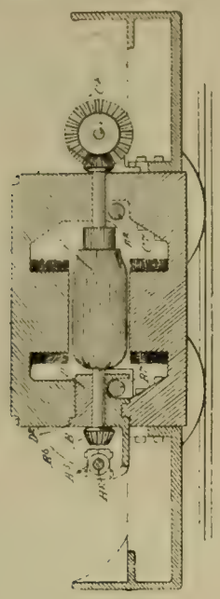
To the Editor:—I have always noticed that the most careless persons in handling Giant powder are prospectors and miners working in a small way, where every cent is needed for "grub" and not even the small cost of a patent powder thawer can be spared. The usual practise of such miners is to lay the powder in the sun to warm. Often when coming out of the mine, when ready to blast, they find the sun has gone under a cloud and the powder is frozen, and the only thing left to do is to thaw it over the forge or a candle with frequent disastrous results. I herewith submit a method of thawing powder which has at least the advantage of costing nothing, and I believe to be absolutely safe:

Take an empty square gallon syrup can, make a wooden box 1 foot deep and large enough inside to

Inexpensive Powder Thawer.

set the can and leave a space 1½ inches all around the can. Line the inside of the box with three or four thicknesses of canvas, put 1 inch of sawdust in the bottom, fill the can with water as warm as you can bear your hand in, set in middle of box and stand sticks of powder upright all around it. It will hold twenty or twenty-five sticks. Stuff a gunny sack down on top and the powder will keep in good condition for twelve hours in the coldest weather. Prepare before starting to work and you will always have powder ready when you want to blast.

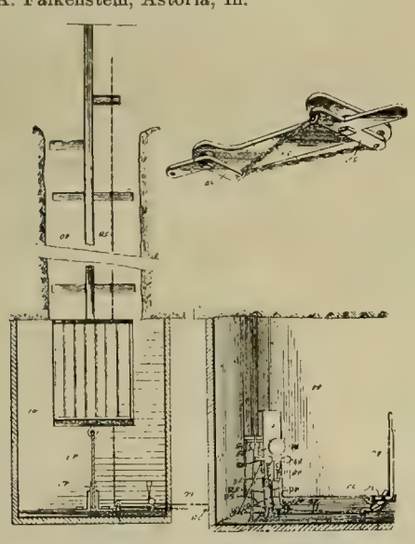
Ouray, Colo. MINER.



Artificial lumber drying is to have experiment on new lines. Eastern lumbermen handling woods naturally refractory to the accepted process of hot air drying are making a series of tests in lumber drying by a cold air process. The modus operandi is essentially the same as in the hot air process, save that dry cold air is used instead of hot air. The experiments have so far resulted successfully. Lumber subjected to the process is said to show a result in dryness equal to the best hot air process, free from check and stain, and an added advantage is claimed in economy of operation. It is stated that the best and most economical results are obtained with the temperature just below the freezing point. Experiments are now being made to determine the cheaper of two processes of supplying dry cold air to the drying houses.

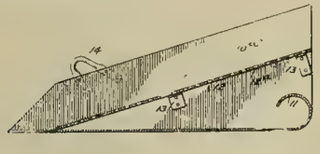
Latest Mining and Metallurgical Patents.

Patents Issued March 20, 1900.



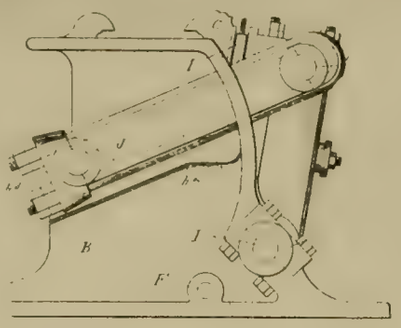
Specially Reported for the MINING AND SCIENTIFIC PRESS.

MINE HAULAGE LOCOMOTIVE.—No. 645,553; C. E. Davis, Chicago, assignor, by mesne assignments, to the Link Belt Machinery Company.



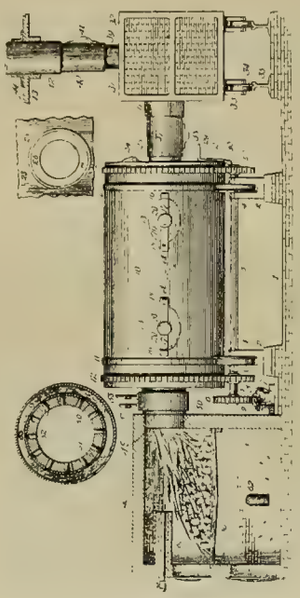
A mine locomotive comprising four wheels, the axle of one pair of wheels being swiveled so as to move with relation to the frame in a plane substantially perpendicular to frame, side couplings between different pairs of wheels comprising a connecting rod provided at each end with concave spherical shaped surface adapted to work on the surface of a ball or sphere surrounding wrist pin projecting from wheels.

MINE SIGNAL.—No. 645,558; J. B. Falkenstein and G. A. Falkenstein, Astoria, Ill.



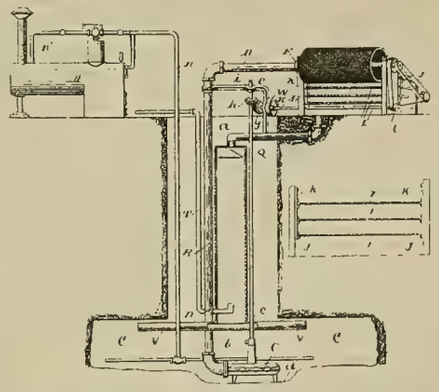
A signal apparatus comprising base, frame pieces mounted thereon, guideways in frame piece, movable signal boards mounted in guideways, racks thereon, additional guideways in frame pieces, movable blocks mounted therein with dogs pivoted in blocks adapted to engage and disengage racks, means for moving dogs into engagement with racks and for subsequently raising dogs to raise racks, pawls adapted for engagement with racks to hold them at different elevations, weighted arms connected with pawls to hold them in operative positions, an alarm comprising elements lying in path of movement of dogs for operation thereby, and means for operating arms to release racks.

GOLD SAVING DEVICE.—No. 645,864; A. M. Lyon, New Westminster, Canada.



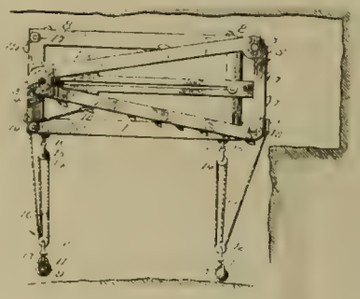
A gold saving dredging and sluicing device, consisting of a box open at both ends, having vertical sides sloping upwardly and rearwardly, a trap 11 extending across rear part of bottom, front part of bottom being of crescent form; in combination with grid or grizzly placed within walls of box with its front end resting on bottom of same and rigidly supported on plane parallel with top edges of sides.

CRUSHING MACHINE.—No. 645,586; M. G. Bunnell, Chicago.



A crushing machine with crushing hopper comprising movable crushing jaw; swinging supporting links having upper ends pivotally connected with lower end of jaw, and lower ends pivotally supported below same and to rear of upper ends; pitman backing and operating jaw; antifriction rolls or balls arranged between jaw and pitman; eccentric applied to lower end of pitman; tension links having rear ends pivotally connected with upper end of pitman and forward ends pivotally connected with frame at points forward of movable crushing jaw.

APPARATUS FOR OXIDIZING OR ROASTING REFRACTORY ORES.—No. 645,761; R. A. Stewart, Kansas City, Mo., assignor to Stewart Oxidizing Company, Colorado.



A rotary ore retaining cylinder having a neck passage, a furnace communicating thereto, means for discharging steam and air into neck passage, door closing rear end of cylinder and provided with exit opening and surrounding neck, stationary track, and stack consisting of movable portion provided with wheels resting thereon and stationary portion, the movable part having pipes telescopically connected to stationary portion and to neck of exit opening.

MINING APPARATUS.—No. 645,861; J. A. Laycock, Litchfield, Ill.

Mining apparatus comprising water supply and heating device for mine, centrifugal pump within mine having outlet outside of mine, rotating and reciprocating separator, the outlet pipe in communication with rotating element of separator, vertical revoluble shaft connected with centrifugal pump within well and extending to point above and outside of well, a horizontal shaft having one end operatively connected with pump shaft and opposite end operatively connected with reciprocating and rotating element of separator.

DEVICE FOR MOVING MINING MACHINES.—No. 645,687; S. F. Lechner, Lindentree, Ohio.

Combination of mining machine provided with endless carrier or chain having connected thereto combined cutting blades and draft hooks, pulleys 17 located upon frame 1, pulley blocks 12 and 14, ropes located around pulley in blocks and means for holding ropes in fixed position, means for connecting pulley blocks, ropes to combined cutting blades and draft hooks.

HUMID PROCESS OF EXTRACTING THE METALS BISMUTH OR ANTIMONY FROM THEIR SULPHIDE ORES.—No. 645,490; J. Ranald, London, England.

A process of extracting bismuth or antimony from its sulphide ores consisting in crushing the ore to be treated, bringing a solution of ferric chloride to or about boiling temperature, introducing the crushed ore into the solution while at the stated temperature, separating the liquor from the tailings, precipitating from the liquor the bismuth or antimony by means of metallic iron, then converting the ferrous chloride thus produced to ferric chloride and metallic iron in quantities the same as those originally used and repeating the operation with another charge of crushed ore using the same ferric chloride and metallic iron for this charge and so on with each charge of ore.

The Fastest Vessel Afloat.

The British torpedo destroyer Viper, which recently speeded 35.5 knots an hour, is the fastest vessel afloat. A speed of 35.5 knots is nearly 41 statute miles per hour. The Viper's principal dimensions are: Length, 210 feet; beam, 21 feet; displacement, 350 tons. The indicated horse power is about 11,000. The turbine engines are in duplicate, and consist of two distinct sets, one on each side of the vessel. There are four screw shafts in all, entirely independent of one another, the two shafts on one side being driven by one high and one low-pressure turbine respectively. The two low-pressure turbines drive the two inner shafts, and to each of these shafts a small reversing turbine is also permanently coupled and revolves idly with the shaft when going ahead. These reversing turbines provide sufficient power to drive the vessel astern at a speed of 15 knots. The screw shafts are carried by brackets, as usual, and two propellers are placed on each shaft, the foremost in each case having a slightly lesser pitch than the after one. There are thus eight propellers in all. The thrust from the screw shafts is entirely balanced by the steam acting on the turbines, so that there is little friction.

The boilers, auxiliary machinery and condensers, are of the type usual in such vessels, but their size is somewhat increased to meet the much larger horse power to be developed. This compensates for the lesser weight of the main engines, shafting, propellers, as well as the lighter structure of the engine beds. The boilers are of the Yarrow type.

ON a reasonable computation stratified rocks attain an average thickness of 100,000 feet. While some of the sedimentary rocks have grown a foot in 730 years, others have taken 6800 years to rise to that height. Thus the period of time that was required to build up 100,000 feet of sedimentary rock has varied, according to locality, from 73,000,000 years to 680,000,000 years, and this gives us some idea of how old the world is. The active work of creation lasted at least for a cycle intermediate between these two figures. Since man began to observe, there has been no change in the forms of animal and vegetable life. A few species have disappeared, but not one new specimen has been evolved. The fauna and flora of ancient Egypt, depicted on monuments, which are probably 10,000 years old, are identical with those that are found in that country to-day, and shells which inhabited our seas before the ice age are the same species that are found in the waters of our bays to-day. But how vast the shortest period we can assign to the gap that divides us from the remote period when these animals and vegetables were first created. Gradually the geologist is lifting the veil which covers the prehistoric record of our planet.

Prospectors' Mistakes.

NUMBER I.

Written for the MINING AND SCIENTIFIC PRESS by "A PROSPECTOR."

Fallacious ideas innumerable afflict the average prospector. By average is meant not half but nine out of ten. In the search for gold mines the intent of the prospector is to find a deposit of rock, be it in whatever form it may—veins, large or small, or dykes, reefs or whole mountains—that will yield a sufficient quantity of gold per ton to give a profit in mining and reduction. Yet how few, in their hunt for gold, realize or even think of just what is meant by cost of mining and reducing.

A prospector finds float and horns it. It contains free gold. He looks farther and finds the ledge. He immediately proceeds to trace its course and locate it. After uncovering portions of the vein he picks out several pieces—invariably pieces that look best and containing more mineral than the rest—takes them to camp, crushes and pans them. A few of the pieces, or even all of those he has selected, prospect well—$5, $10, $20 or even $100 per ton in free gold, according to his estimation. This particular prospector, being one of the majority, has not—although you could not make him believe it—the least idea how much gold from a small piece of rock must be shown, in horn or pan, in order to prove the ton to contain $5 or $10, far less the amount necessary to show a $100 prospect.

Not only has this prospector deceived himself as to the value of the samples he has panned, but extends the fallacy by imagining the whole ledge to be equal in value to or approximating the value he has placed upon the samples.

Having proven to his satisfaction the value of the ore, he proceeds to explore it underground. He may go to the trouble of building a house or he may have a tent, yet he spends some time in getting ready for work. He works day after day in running a tunnel, or, if he has help, in sinking a shaft. Generally, though, he starts a long crosscut tunnel to "tap the vein deeper"—which sounds very well to one who has never tried it.

He continues such work until, during the interval in which he has not had to rustle for another grubstake, he has contrived, by hard work and by spending all the money he has been able to earn in a year or so for provisions, powder, etc., to run his tunnel in to the ledge, and perhaps drift a few feet, if he has found a ledge at all where it ought to be.

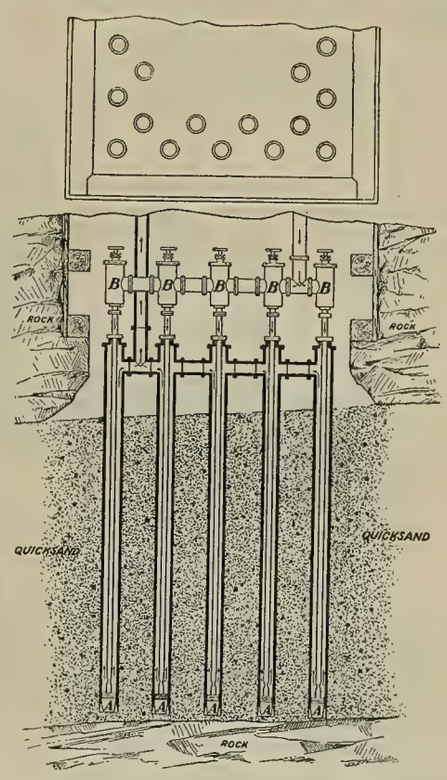
He has now proven (?) that he has a mine, as it horns where he cut it with his tunnel, and forthwith proceeds to find a purchaser for his claim or some one to put up a mill for an interest.

If there has not already been some one along who has examined his find, all he has to do is to proclaim the fact that he has a mine for sale. Some one who knows a prospect worthy the name, when he sees one, will go and see it, willing to buy or put up any amount of money to develop it, if there is the bare possibility of its proving to be a profitable undertaking.

If this prospective purchaser cannot see at a glance, or satisfy himself by horn tests, that there is nothing there, he will sample what ore is in sight and have the samples assayed. He may find that the ore is not worth $1 per ton on the average, and so notifies the owner of the crosscut tunnel. If this prospector has common sense he will consider the advice of this man and see for himself that he has put all his labor and money where, from the start, there was absolutely nothing to even encourage him to locate the ground. If he is like some of his kind, however, he will consider the expert, or whoever he was, a bilk and "don't know what he is talking about."

Another job and a few dollars earned finds him back again, even if only to do the assessment work, and so on until he is compelled after several years, and as many vain attempts to interest some one with money, to realize that his mine is not what he thought it was.

What a simple matter it would have been for this prospector to have taken a few samples of average ore that he had found on the surface and, by mixing and the exercise of a very little judgment in reducing the bulk, to have secured a sample or two that would have told him, perhaps not accurately but nearly so, the value of such ore. If he was satisfied that the values were wholly in free gold, it would have been an easy matter to weigh a pound of the ore and pan the gold out; and if he could find no means of weighing the gold he could find some one who could tell the difference between a trace, a color, and a cent to the pan. If he obtained a cent he would know that there would be $20 in a ton; if he got but a few colors he ought to have known that his ore was too low grade to even justify looking further. If this prospector did not like to trust his own calculations, two or three assays, costing $2 or $3, would have saved him all the work and money he has thrown away.



The mistake of this prospector lies in imagining that because his prospect shows some free gold he must naturally have a mine, without stopping to consider the exact or even approximate value per ton in dollars and cents, the amount of ore in a section of the vein necessary to admit of reasonably cheap mining, the cost of milling, etc., without counting the cost of a mill, the cost of putting his prospect in shape to extract ore, and the amount of ore of a certain grade necessary to justify all these expenditures.

(TO BE CONTINUED.)

Mining With Aid of Refrigeration.

At Lake Superior, and elsewhere, dolomite quicksand is frozen into solidity and then a shaft sunk through as though the substance were solid rock. The sand shaft at the Trimountain mine was dropped through sand to bedrock, a distance of 106 feet, in five weeks. At the Wyandot, ten miles south of the Trimountain, they have been trying for a year to get sand pipes through the overburden or sand and have not yet succeeded. W. S. Smith has frequently found it necessary to sink stand pipes in a circle all about a sand shaft and freeze the shifting sand to solid rock by circulating ammonia in the pipes. This is an expensive process. The Trimountain shaft has cost considerably less.

In Poetsch's freezing apparatus, herewith illustrated, the object is to absorb heat from the quicksand; this is done by causing an intensely cold fluid to circulate through a series of tubes, so disposed that each absorbs a share of the heat to be abstracted. The cold fluid is made to circulate like air in a mine, and by reference to the illustration it will be seen that there are intake and return currents,

Poetsch's Freezing Apparatus.

and even splits in the circulation. The intake or downcoming current enters the inner tubes as shown at B, B, etc., and the absorption tubes envelop the small inner or intake tubes that are 2½ inches in diameter, while the return tubes are 8 inches in diameter. The circulation may be noted by observing the ascending fluid returning by the arrows as at A, A, etc.; further it will be noticed that the cold fluid is supplied by a main return and a main intake tube. The circulation of the cold fluid is continued until an ice dam 5 feet thick is formed round the shaft, then the frozen sand within the shaft is taken out, and the sides are secured with a permanent dam of wood, cast iron, stone, or brick. For fixing the absorption tubes in the sand the bottom as well as the top ends must be left open, because otherwise the buoyant power of the quicksand would prevent the easy entry of the tubes. After the tubes have been sunk into their required position, lead plugs are dropped into them to close the bottom ends which have a contracting taper; after this the sand is removed from the insides of the tubes, and the plugged ends are made tight by covering the heads of the plugs with alternate layers of pitch and cement, the object of the cement being to fill the cracks in the layers of pitch, for if the absorption tubes are not perfectly tight the escaping fluid prevents the freezing of the sand, by the diffusion of the chloride into the water.

Sinking vs. Tunneling in Development Work.

TO THE EDITOR:—In a recent issue of your paper, I note the following statement: "As between tunneling and sinking to strike the vein, the advantage ordinarily lies with sinking. The tunnel is self-draining; it needs no hoisting machinery; the cost per foot is less; timbering is easier provided for. Where the enterprise is not on an unusually large scale, and the distance is not over 3 feet of tunnel to 1 foot of shaft sunk, the tunnel is deemed preferable. Of course, special circumstances govern every case and no general rule can apply."

Being one who, in the earlier part of my mining career (which has now extended to nearly thirty years), followed the above rule, entitles me, I am vain enough to believe, to the right of asking permission to challenge the aforesaid method of mining. It does not follow that, because a man has seen nearly thirty years in mining, he knows it all, or that he should criticise and put himself forward as a competent judge as to the proper system of opening up and operating mines; yet to him who has learned something by reason of the application of a practical knowledge, with that of a theoretical one during an unbroken experience of a quarter of a century, should be due some consideration for an opinion involving so vital a question to the welfare of mining.

I can not reconcile myself to the belief that it is right or that it is proper mining to tunnel 300 feet and get but 100 feet of a vertical depth or stoping ground, nor any greater distance at the same ratio. To my way of thinking there are only two reasons—and only one of them is right—why tunnels should be driven at all, i. e., a natural tunneling location or proposition, as the miner says; the other reason is extreme poverty on the part of the owner or owners. Of what use is it, let me ask, to drive a tunnel 300 feet—we are now speaking of crosscutting—to strike a vein when such shallow depth, in eight cases out of ten, taps the lead and finds it in an impoverished condition, proving nothing, you might say, as to its permanency? The poor owner is now confronted with the question or conditions as they were in the first place, namely, a $400 hoist and the sinking of a shaft. Because tunneling can be done a little cheaper does not make such methods justifiable or repair the mistake. The fact that a "tunnel is self-draining" should not serve as an inducement to drive one, for, finally, pumping machinery must handle this water. To ventilate a shaft does not cost any more than that for a tunnel. A tunnel 300 feet in length, which cost, we will say, $7 per foot, will sink a shaft of ordinary size 210 feet; and if the vein be a vertical one, and the shaft is sunk on it, it will assist largely in paying its way in its development. A tunnel driven 600 feet to give 200 feet of "backs" would cost, at the rate of $7 per foot, $4200. This amount would sink a shaft of suitable size 200 feet, buy the hoisting and pumping machinery, cage, cable and a good size air compressor—everything complete and sufficient to sink and develop the mine to much greater depth.

Throughout the mining districts of Colorado, California, Oregon and Washington the silent, graveyard-like appearance and condition of numerous good prospects and mines give refutation to the tunneling fallacy. The poor owner, after "gophering" and "stumping" at grass roots and tree roots, having wearied of futile efforts to make a good, profitable mine of his property at the enormous depth of 100 feet, is now "resting" and waiting for the capitalist to come and buy him out. The capitalist comes—of course he does—and he knows a good thing, or his expert does, when he sees it. He buys him out for half, or less, of what it is worth. The capitalist equips the mine and in very short order strikes it big, and demonstrates just what the other fellow would have done "if he had had a little more money." Had the poor owner bought nothing else but a whim, he would have attained sufficient depth that would have enabled him to judge of the true value of his mine.

In a large majority of cases a depth of only 100 or 200 feet upon a true fissure vein proves nothing, and a tunnel extended to tap the ledge at such shallow depth is almost a dead loss; its usefulness for the further and future working of the mine practically ends at its level. It remains there a glaring and constant reminder of a costly blunder. However, if the poor or otherwise mine owner or prospector be not an expert himself, he should, in the first place, seek some such advice. Experts of all descriptions abound everywhere; the woods are full of them; they are in evidence in every mining camp, village and hamlet. Their advice has accumulated to such an extent that it has gushed over, permeated and saturated the atmosphere so that it is dirt cheap and can be had without the asking. The man with the tripod on his shoulder; the man with a miniature compass dangling at his watch charm; the hungry theorist who has devoured Le Conte and Dana in volumes; the mine promoter; the clerk in the mining company's office; and last, but not least by any means, the metallurgical crank and the assayer—all are experts. It requires, though, an expert of another kind to pick out the real competent expert of mines from the fakir and impostor.

J.

Spokane, Wash., March 19.

MINING SUMMARY.

ALASKA.

The United States Government forbids the carrying of gasoline on any steamers carrying passengers to Cape Nome. The Standard Oil Co. says it will place as much gasoline at Nome as will be necessary to meet the demand.

A Cape Nome letter says: "The country is being staked and re-staked from the Arctic to the Yukon. All the claims staked in '98 were re-staked on the 1st of January, and some claims are as full of stakes as were the claims in Atlin. Kimball & Co., of San Francisco, have a preliminary survey for a railroad along the beach from Port Safety to Port Clarence, eventually to connect with Siberia by means of a tunnel under Behring straits. This is regarded as a scheme to lay under tribute the coveted beach diggings."

At Victoria this week a combine of the Canadian Pacific Navigation Co., White Pass & Yukon Railway Co. and the John Irving Navigation Co., to control all transportation business during the present season, has been completed. Through freight rates have been fixed at $97 a ton on general merchandise in less than five-ton lots, or $87 for larger shipments. The mining machinery rate is $67, with a limit of measurement.

ARIZONA.

GILA COUNTY.

Supt. Cook of the United Globe has fourteen boxes of copper specimens for the Paris Exposition, none of which go less than 25% copper.

The Old Dominion C. M. & S. Co. has 125 men employed to maintain organization, says the Silver Belt.

The Black Warrior Copper Co., Amalgamated, has a great flow of water, more than required to run the entire works, to which the water will be piped two and a half miles. Five carloads of 4-inch pipe will be used.

An Old Dominion stockholder says: "During January the Old Dominion produced 500,000 pounds of copper and during February this production was increased to 700,000 pounds. The Old Dominion development work is three years ahead. The mine will start up whenever a supply of coke can be secured. When new stock now in the treasury is issued, the proceeds will be used to build a railroad from the Old Dominion to the Continental mine.

GRAHAM COUNTY.

Near Clifton a strike is reported in the Shannon mine of copper sulphide.

Thirty miners are at work in the Ash Peak district, principally on the Commercial group.

The Belle mine, on the reservation strip, is bonded to the Mt. Turnbull M. Co. for $75,000 for twelve months. Men are to do development work.

MARICOPA COUNTY.

Operations of the smelter combination of the Rocky Mountain region, which forced the closing of the pyritic smelter at Silver City, N. M., have affected the mining industry of Arizona, principally in the northern part of the Territory. "The output of copper ores from northern Arizona has been curtailed because some of the ore will not permit of treatment by any other than a pyritic process," says H. P. Anewalt to the Prescott Herald. "By the closing of the Silver City works all avenues for sending pyritic ores to a plant where they can be profitably reduced have been cut off—in fact, the Silver City smelter was the first and only plant to successfully treat pyritic ores and its shut-down knocks out a considerable reduction of copper." According to this the McCabe and Gladstone mines of the Big Bug district, which were important producers of pyritic stuff, have been forced to suspend shipments and operations are now confined to development. The outcome of the Silver City smelting troubles is not encouraging to the Big Bug district, where the ores are heavily impregnated with sulphur and lime, although if developments continue, as they have in the past, the inability to ship ores may prove beneficial to the mine owners by creating the necessity of smelting ores close at hand.

YAVAPAI COUNTY.

(Special Correspondence).—The miners of the Big Bug district are looking with interest to the completion of the Clifford stamp and Cornish roll mill that is to work on the Great Belcher and other ores. The mill will have a daily capacity of 500 tons, and it is expected a low cost of extraction will be reached which would enable many low-grade properties to work. Most ores of the Big Bug district are sulphides, adapted for concentration. The Great Belcher mill will be fitted with Comet & Blake crushers, two sets of Cornish rolls, 36x18 inches, and four sets of Cornish rolls, 30x10 inches. There will be eighty stamps, forty-six concentrators, a roasting furnace with fuse box attachments and a cyanide plant to treat tailings. The intention is to make it one of the most complete concentrating mills ever erected in the United States; the entire cost will closely aggregate $400,000. It is understood to represent the private capital of Henry B. Clifford & Co. A railroad nine miles in length will connect the works with the mines of the Big Bug district.

Prescott, March 26.

The Journal-Miner says that the Zonia Copper Co., whose properties are tributary to Kirkland station, is figuring on putting in a $100,000 leaching plant to work a body of low-grade copper ore.

CALIFORNIA.

AMADOR COUNTY.

(Special Correspondence).—At the Shenandoah Supt. Thornton has a 4-foot ledge of ore that averages $17.50 in gold and $6.25 in silver per ton. He has leased a mill and will begin milling next month.

Plymouth, March 27.

BUTTE COUNTY.

At Oroville it is locally reported that during six days one of the several gold dredgers made an average of $600 a day.

One of the new dredgers on the Feather river between Biggs and Oroville begins next week, the other two weeks later. They will be operated by electricity, under the supervision of A. Berner. The new dredges were constructed after the patent of R. H. Postlethwaite by the Risdon Iron Works of San Francisco, which company will construct another dredge for the Merrigold M. Co., to be operated on the opposite side of the river. The Feather River Exploration Co., after operating the first dredge more than two years, have expended about $80,000 for the construction of two more, which are about completed.

L. Glass and F. McLaughlin have an option on the Big Bend tunnel on Feather river, twelve miles above Oroville, and on adjoining land owned by the same company, together with the water rights, etc., and propose to install an electric plant. The latter is East to interest capital in the scheme.

CALAVERAS COUNTY.

The Melones M. Co.'s gross receipts for the year ended Dec. 1, 1899, were $267,135, expenses $266,836. Ore reserves available for milling at the end of the year were 982,692 tons; probable reserves, 1,651,153 tons. As soon as lumber can be delivered at Robinson's Ferry, work will be resumed on the 120-stamp mill and other works. There will be then 250 men at work in that locality.

EL DORADO COUNTY.

The Democrat reports that J. Lavagnino will work the dumps of the old Union or Springfield mine and that he will build a 10-stamp mill.

At the Kimble mine at Placerville the Republican says Supt. Kimble employs forty men, taking out hard cemented blue gravel from breasts 40 to 75 feet wide and from 2½ to 9 feet deep, which is carried over T rails an average distance of 2000 feet to the ore bin, whence it passes through self-feeders to the ten stamps. The gravel is composed of quartz, slate and rhyolite lava pebbles imbedded in the cementing material. It is all blasted. The bedrock is slate of medium hardness. The stamps are 650 pounds with from 5 to 6 inches drop and a speed of from 96 to 110 drops per minute. A coarse screen and high discharge are used. The discharge is 6 inches with a four-hole screen, 14 inches wide. When the crushed gravel comes from the mill after this process, the cementing material is entirely dissolved into its constituents of sand, mud, etc., and the pebbles of slate and quartz are crushed to about the fineness of grains of wheat. A saving is effected in getting rid of this hard material without crushing it unnecessarily fine, as it contains no gold. No quicksilver is used in the battery and no plates are used anywhere. The tailings flow over a series of riffles perhaps 50 feet in length. They are wooden "cross-riffles"—that is, at right angles to the flow, each beveled from the upper edge of its lower side at an angle of 45°. The result is a peculiar action of the water by which it dances as though a heavy rain were falling in it, and the sand between the riffles never packs, but remains open to gold deposit and amalgamation. The mill can dispose of 322 carloads—1300 pounds each (the capacity of the ore bin)—in a run of twenty-four hours. Power is developed by a 6-foot wheel under a pressure of 176 feet. Wages in the mine are $2.50 for miners and $2 for carmen working shifts of nine hours. Supt. Kimble finds that he is able under these conditions to mine and mill gravel at an expense of 50 cents per carload of 1300 pounds. During one month's run, where no interruptions in the gravel supply occurred, he was able to reduce the cost to 42½ cents per carload. This includes all mine expenses, cost of superintendence, powder, lights, shoes and dies, etc.

INYO COUNTY.

J. Danielson has sold his interest in the Bunker Hill lead mine, Lead canyon, to R. J. Laws for $4000.

The Kearsarge mines, seven miles from Independence, are to be opened by San Francisco men. A 1500-foot tunnel will be run and a mill and cyanide plant erected. J. S. Johnson is Supt.

KERN COUNTY.

The Californian says that Jewett & Blodget have sold their oil properties at Sunset for $500,000 to English purchasers.

Near Bakersfield the Petroleum Development Co. is pumping from nine wells and is boring four others.

The Santa Fe R'y Co. is putting in fuel tanks all along the line and will soon have all its engines converted into oil burners.

At McKittrick J. B. Treadwell has finished his sixth well which is being sand-pumped. Of the five producing wells four are flowing.

At the President the depth of 850 feet has been reached.

McKittrick is producing four carloads of oil daily.

KINGS COUNTY.

The Baby Kings well is reported daily producing forty barrels of oil.

LOS ANGELES COUNTY.

The Los Angeles O. & T. Co. says a deep well will be drilled to the primary oil sand on their property. The Johnson well has been drilled 1400 feet—the deepest well in the Los Angeles oil district. That well is yielding fifty barrels a day, oil and water flowing over the casing. This will be shut off and the well drilled still deeper.

MADERA COUNTY.

The Eastern agency of the California Copper Co. has a shipment of fifty tons of copper matte from Madera valued at $15,000. The smelter of the company is reported to be handling 100 tons of ore per day.

MARIPOSA COUNTY.

Mgr. Madden, at the Francis mine, Mariposa creek, has fourteen men at work on the mine.

NAPA COUNTY.

The Napa Quicksilver M. Co.'s statement for the three months ending March 1 shows: gross receipts, $60,750; operating expenses, $37,395; dividend, $20,000; surplus, $3354.

NEVADA COUNTY.

(Special Correspondence).—Work has been resumed at the Orleans mine, adjoining the Empire on the east, one and one-half miles southeast of Grass Valley. Several miners, headed by C. A. Brockington, formerly Supt. of the Orleans, have taken a bond on the property and are working it on the co-operative plan. They are driving toward the Heuston Hill ledge on the 700 level. This was a rich lead, having produced $500,000 in early days. As they will strike it considerably below the old workings, they have hopes that it may amply reward them for the vast amount of dead work which they will be obliged to do to reach the ledge. There is a good hoist on the Orleans, run by water, and a Cornish pump, and as the mine drains into the Empire there is no trouble with water. The air compressor is run by a 30 H. P. electric dynamo. Water power is used at the 5-stamp mill. The shaft is 800 feet deep.

Development work continues at the Golden Treasure mine, south of the W. Y. O. D. The shaft is 165 feet deep. A drain tunnel takes the water at the 105-foot level. The steam single-reel friction hoist anchored in cement will answer all requirements to 1000 feet depth. The shaft follows the ledge and considerable good ore has been taken out. Frank Dulmaine is superintendent.

The Golden Gate Exploration Co. are operating north of the Maryland mine, near Grass Valley. Their claim adjoins the Alpha on the west. The shaft follows down on the ledge and is 430 feet deep. A drift is being driven west. The ledge averages 15 inches. The equipment consists of a single-reel hoist and a duplex pump, both run by steam. The stockholders are California people, whose interests are well looked after by G. R. Tuttle, superintendent. Twelve men are employed.

The Standard mine, two and one-half miles northwest of Grass Valley, is one of the latest enterprises to begin work. It is an old claim, but nothing had been done upon it for many years until it was taken in hand recently by Hugh J. Thomas, formerly of Colorado, who is Supt. for the San Francisco and Berkeley stockholders. The old company ran two tunnels, one of which struck the ledge at 75 feet; the other tunnel ran into the hill 475 feet, passing through the ledge, which has been found by the new company 325 feet from the mouth of the tunnel. They are now drifting both ways on the ledge. It has widened out from 3 feet on the west to 30 feet on the east, and shows much good ore. A mill test of selected portions yielded $66 per ton.

The Hudson is a mine in Nevada county which is attracting attention at the present time for the reason that it is located many miles from any other active property. It is on the north bank of Deer creek, three miles northwest of Rough and Ready, adjacent to early placer diggings along the creek. A stamp mill was placed on the property twenty years ago, and considerable ore was milled without using concentrators or blankets. The tailings from this mill, as well as much waste rock thrown aside by the old company, but which is found to prospect well, are to be run through the 4-stamp mill now being erected. The shaft at the Hudson goes down on the ledge and is 184 feet deep. The ore is free milling above water level; below that point it carries copper and is heavily sulphuretted. The ledge is 3 feet thick and inclines to the east about 70°. The new company has cleaned out an old Excelsior branch ditch and by laying 1200 feet of pipe will secure a head of 300 feet, enabling them to run hoist, pump and mill by water power at comparatively light expense. Thirty tons of tailings and ore can be daily run through the mill. The company is composed mainly of San Francisco business men. E. R. Rockwood is president, H. W. Matthews secretary, J. W. Morrow superintendent, C. W. Gertridge accountant and business manager, J. T. Strickland foreman. Superintendent Morrow thinks he has a valuable gravel proposition on the land of the company a short distance below the mill.

The Jenny Lind mine, near Grass Valley, was originally a promising gravel proposition. While running a tunnel into the hill a year ago to strike the gravel channel a quartz ledge 2 to 4 feet thick was found. Crushings have been made therefrom, with results so satisfactory that the company contemplates the erection of a 10-stamp mill. Another tunnel, now being driven, will give sufficient backs to supply a mill. This is a local company, with Wm. Treloar president, Arthur Powell secretary and Charles Stocks superintendent.

Work in the Holbrooke gravel mine, on the Rough and Ready ridge, southwest of Grass Valley, has been discontinued. The pump has been removed to the Seven-Thirty quartz mine, to the south. On the south slope of the ridge I. Haas, I. Stein and Chas. Melish of Grass Valley own 140 acres, through a portion of which the Holbrooke gravel channel courses. Geo. Martel and Mr. Melish have the property leased. They have taken gravel out of a self-draining tunnel and by sluicing have got considerable gold. The gravel is not cemented. They are now preparing to run another tunnel near the center of the channel. This claim is known as the Alta-California and has been worked off and on for eighteen years.

Still farther along on this channel is the Sazerac gravel claim, which is being worked on a lease by Jas. Gluyas, W. W. Dibble and Cyrus McMath of Grass Valley. These miners have explored their ground to some extent by tunnels and drifts, but were embarrassed by the water backing up on them. They have leased the old Smedley tunnel, opening into lower ground, and are reaching their gravel bed through drifts therefrom. The character of the gravel is improving. It is cemented and put through an arrastra, run by water piped 700 feet and giving 150 feet pressure. They work about twenty cars of gravel per day.

Grass Valley, March 20.

The Orleans Con. M. Co. has incorporated at Grass Valley; capital, $100,000; M. W. Fox, G. P. Thurston, G. D. Gray, J. W. Swift, H. B. Montague, directors.

SAN BENITO COUNTY.

The New Idria Quicksilver M. Co.'s statement for the three months ending Feb. 28 shows: gross receipts, $47,475; operating expenses, $24,405; dividend, $20,000; surplus, $3069.

SAN BERNARDINO COUNTY.

At Havilah the Warrington mine has paid off all the indebtedness and work will be resumed.

SAN DIEGO COUNTY.

The new cyanide plant at the Golden Cross mine at Hedges started on the 24th. It has a daily capacity of 333 tons of tailings. By June it is expected the capacity will be increased to 1000 tons. It is contemplated to enlarge the present mill to 200 stamps. Water is pumped from the Colorado river, twelve miles.

SAN JOAQUIN COUNTY.

The Crown Mills of Stockton have bored a gas well 2000 feet deep and have a daily supply of 18,000 feet of gas. The cost was $5000.

SHASTA COUNTY.

(Special Correspondence).—Two feet of $140 ore was recently discovered in the

northern portion of the Summit mine, seven miles northwest of here. Good ore is being stoped in the 400-foot upraise of the lower Summit tunnel. The owners of the north extension, Barlow & Co., of the Summit, are preparing to develop that property.

Ono, March 25.

The statement that the Mountain Copper Co. had raised the wages of the miners, muckers and timbermen employed at Iron Mountain is denied by the Free Press.

Mgr. Filius will put in a 6-drill compressor at the Shasta King group, and projects the use of water power from Squaw creek.

At De Lamar's Bully Hill mines a water jacket of 150 tons daily capacity will be built, and a converter big enough to handle the matte of three such furnaces. No refinery is in present contemplation.

SISKIYOU COUNTY.

(Special Correspondence). — At the Knownothing mine, G. W. Grayson & Co., owners, on Knownothing creek, Supt. Foley keeps its 8-stamp mill running on good ore. The source of supply is a shaft now 115 feet deep showing 3 feet of pay ore.

Its neighbor, the Gold Run group, is sinking a winze, now 90 feet in depth, with power drills, in its lower tunnel. The 4-foot vein in it, including considerable waste, mills $8 per ton in free gold, although the main ore body of the Hunter vein has not been reached yet.

Yreka, March 28.

Contestants are given further time to protest against the application of the railroad for certain lands and to file proper affidavits. In response to a query as to what a "proper affidavit" is, the Commissioner of the General Land Office says:

Where entry has been allowed and remains of record, the affidavit of contestants must be supported by the affidavit of one or more witnesses.

Proof of mineral location should be made by filing certified copy of location notice, and it should be shown whether the mining claims cover all or only a portion of the tract protested.

The protest attacking a claim of record should be supported by all the evidence of which the case is capable.

Protestants will receive notice of this ruling and will then be allowed sixty days to make protest in compliance with the rulings. After this the department will order a hearing at its pleasure.

TRINITY COUNTY.

About 100 men are to be put to work next month on the Paulsen properties on Trinity river, recently bought by the Last Chance M. Co. The purchase included the Union Hill mine near Douglas City, one-half interest in Dutton claims near Weaverville comprising 1670 acres; the price was $125,000. W. H. Hile is Gen. Mgr. and expects that his company will have the mine in full operation July 1st.

YUBA COUNTY.

Constructing the four restraining barriers in the channel of the Yuba river near Deguerre Point will begin when title has been secured to the necessary land. It is expected 1000 men will then be at work.

Irvine & Co, of New York City, are interested with W. Kolman, lessee New Blue Point mine at Smartsville, to operate the property by milling. Two cement mills, with a daily capacity of 500 tons, will be used.

TUOLUMNE COUNTY.

Supt. Hardy of the Santa Ysabel, near Stent, is not doing much at present. The Boston owners contemplate reorganization. The committee for that purpose report as follows:

"The experience of other mines near this property on the mother lode has shown that when ore has proved of little value near the surface pay ore has usually been found again at a depth of from 1200 to 1500 feet. Judging from what we have been able to learn of the appearance and record of the mine and its reputation among mining men, the committee feels that it should by no means be abandoned as a failure, but that an effort should be made to find pay ore at greater depth. The appearance of the ground at the Knox & Boyle chute especially warrants further development. The exact line which should be taken to accomplish this development, and the depth at which the attempt should be made to find the pay ore, must depend upon the advice of the expert who will soon examine the property.

"The debts of the company which must be provided for amount to $65,000, of which $34,000 are notes payable falling due in November and January next, besides certain current liabilities incurred with the approval of the committee since the mine was shut down about March 1. The capital stock of the company is 130,000 shares of $5 each and is not assessable. In order to provide the necessary funds the committee recommends that a stockholders' meeting shall be called in Cheyenne, Wyoming (the legal domicile of the company), as soon as practicable, to act upon the following proposition:

"That all the property of the company be sold at private sale for an amount sufficient to pay its debts, to a new company to be organized under the laws of Colorado, with 150,000 shares of the par value of $5 each, assessable, but assessments not being collectible against other property of the stockholder, the right being reserved to each present stockholder to receive an equal number of shares in the new company of the same par value, upon paying $1 per share, the remaining 20,000 shares to remain in the treasury of the new company, subject to sale by the directors for the benefit of the property. As many of the holders of notes payable have signified their willingness to extend the time of payment, we recommend that the trustees of the present company be authorized to accept from the new company a satisfactory agreement to assume any debts, if satisfactory to creditors, and the obligation of the present company is released.

"We recommend that an underwriting subscription should be made to take the shares of the new company not taken under the terms above stated within sixty days from notice that the new company is ready to receive subscriptions at $1 per share, without commission, any stockholder to have the right to join the underwriting with others, and allotment to be made as nearly as practicable pro rata among the underwriters, except that preference shall be given to such stockholders. We recommend Colorado as the domicile of the new company, being advised that the laws of that State are most favorable for the kind of organization that we propose. The number of trustees of the present company is nine; under the laws of Colorado any number of directors from three to thirteen is permitted. We recommend that the number remain at nine. Mr. Charles Pfaff has consented to accept the presidency of the new company. Of the remaining directors we propose that one-half be selected from stockholders not on the present board. The new company will take new officers and elect its own officers. We expect to submit to present stockholders, before they shall be called upon under the above plan to pay the assessment, the report of the expert on the property and the best way to develop it, but as the course we recommend will occupy at least a month we do not deem it desirable to postpone action until the report can be made. We desire that operations shall be resumed as soon as possible for several reasons, chief of which is the fact that at present ample power can be secured from the water power of the company at a minimum of expense, and this power may be lacking later in the season. W. B. Buckminster, E. H. Mason, W. F. Fitzgerald, W. D. Middleton."

COLORADO.

The official U. S. Mint reports of the mineral production of the State of Colorado in the year 1899 as revised is received, as follows:

COUNTY.	Value of gold.	Coinage value of silver.	Total value of gold and silver.	Value of lead.	Value of copper.	Total value.
Arapahoe	$ 62	$ 1	$ 63	$	$	$ 63
Boulder	542,631	97,758	640,389	1,250	13,720	655,359

Commercial value of silver, $13,707,882.

BOULDER COUNTY.

At Boulder the Delano mill resumes work April 10 by the Atlas Reduction Works, C. D. Grove Supt.

CLEAR CREEK COUNTY.

(Special Correspondence). — Samples from a body of ore opened in the Scepter tunnel, on the Astor group, assayed 417 ounces gold, 69 ounces silver, 31% lead. It is claimed the 400-foot tunnel named runs alongside the ore body for 300 feet. The ore streak is about 2 feet wide.

Georgetown, March 26.

EL PASO COUNTY.

The Standard Reduction & Smelting Co. will build its new works in Colorado City. The mill will have a capacity of 400 tons daily.

A new mining exchange building is to be erected at Colorado Springs, Colo., to cost $200,000.

GILPIN COUNTY.

The Gregory, Bob Tail, Cook & Fiske groups, near Central City, are reportcd sold to a French company. There are about forty claims, with a gold-producing record of $14,000,000.

The California mine is being unwatered to the 2250 level, where drifting will be carried on. At the Hidden Treasure a small hoister will be put in the 1400-foot level, to sink a winze from that level to the California 1700 level.

GUNNISON COUNTY.

At Vulcan ore has been struck in the Midland mine—3 feet of high-grade shipping ore.

LAKE COUNTY.

(Special Correspondence).—The Silver Cord M. & L. Co. has been organized by Max Strauss, C. P. Schumacher, W. L. Cooper, J. B. Frank and N. L. Burton, all of Denver, to operate the Silver Cord group on Iron hill, on which the new company has a four-year lease.

Leadville, March 24.

(Special Correspondence).—The Stevens shaft of the Iron Silver M. Co. has been unwatered. A new compressor and pumps will be put in position for work. The shaft is now 550 feet deep, and Mgr. T. E. Schwarz thinks sinking may be resumed.

Leadville, March 26.

Thorough development of the low-grade ore in the Hap Hazard mine is proposed, the idea involving the building of a mill for its treatment.

The Gordon mine at Twin Lakes is sold to Milwaukee men for $50,000.

LARIMER COUNTY.

(Special Correspondence). — The new copper finds in this county are attracting mining men this year. It is claimed by those who have made investigations that a belt, more or less copper mineralized, extends northwesterly from Fort Collins almost to the Wyoming line and has a width of four miles in places. The country rock is granite schist, with porphyry dikes cutting the formation.

Fort Collins, March 24.

MONTROSE COUNTY.

(Special Correspondence).—Uranium has been found on the surface in the northern part of this county. A sample showed 29% of that metal. A shipment of 1400 pounds was made to Denver, returns therefrom amounting to $500 for the uranium in the ore. The deposit is said to be a large one.

Montrose, March 26.

PARK COUNTY.

(Special Correspondence). — A force of twenty men is at work on the Ling mine, near Alma, under the management of F. A. McIntyre of Denver. The ores consist of sulphides, carrying lead, copper and gold. The property is now shipping.

Alma, March 23.

PITKIN COUNTY.

At Aspen it is rumored that the Mollie Gibson is to be unwatered.

SAN JUAN COUNTY.

(Special Correspondence). — Rich gold and silver ore is struck in the Willie lode, on Anvil mountain, near Silverton. The property belongs to Wm. Beilfieldt & Son. The highest values are in white quartz.

Purpus & Williams have a four years' lease of the Red & Bonita mill, near Gladstone, and propose to run on ore from the Tilden and Queen Ann groups.

Silverton, March 24.

SAN MIGUEL COUNTY.

The Butterfly at Ophir is working in good ore and the stamp mill is running to the limit of the water supply.

SUMMIT COUNTY.

(Special Correspondence).—The Breckenridge Deep M. Co. have taken over the group of the New York M. & D. Co. on Shock hill, on which the latter company spent $30,000 in development. The former company is largely made up of local people, whose purpose is to thoroughly prospect the locality by sinking the present 300-foot shaft to greater depth, in the hope of striking the contact ledge known to cut through that section. C. A. Finding is manager of the home company.

Breckenridge, March 23.

(Special Correspondence).—The new 20-stamp mill on the Excelsior mine is operating, crushing sixty tons of ore per day, the product shipped being four cars per week of concentrates. The mill is run by electric power, generated by water power on Ten-mile creek. A. B. Ogden is Mgr.

Frisco, March 26.

TELLER COUNTY.

At Cripple Creek the Doctor mine is reported producing 100 tons a day, which averages $100 per ton, or $10,000 a day, from between the 400 and 600-foot levels.

IDAHO.

ADA COUNTY.

Boise has accepted the proposition of R. J. Anderson, representing the War Eagle Co., to establish a milling and concentrating plant there, if the Boise people raise $10,000, to be loaned to the project, the business to be in the hands of trustees.

LATAH COUNTY.

Thirty men are employed in the Muscovite mica mine, twenty-six miles east of Moscow. Five carloads of block mica are out ready to dress, and seven carloads have been shipped out this season. Two hundred pounds of cut mica were shipped from Vollmer last week.

SHOSHONE COUNTY.

W. E. Seitz is running the Golden Chest mine at Murray and has a controlling interest in the Dora, Katie Burnett, Idaho and Paymaster. It is thought the machinery of the mills must be moved to a better location.

At Wallace the Canyon Creek M. Co. will run its tunnel 100 feet and cut the ledge at a depth of 525 feet below the surface.

MICHIGAN.

The annual report of the Tamarack M. Co. for 1899 shows during the year:

Received from sales of copper	$2,952,098
Total costs	2,211,588
Mining profit	740,510
Dividends	600,000
Surplus	140,510
Tons rock hoisted	775,532
Tons rock stamped	631,090
Cost stamp ton	22.727c

During the year $400,651 was spent for construction and charged directly to operating expenses. Supt. Parnalls' report says: The total shaft sinking amounted to 1065 feet. No. 5 shaft is now down 3918 feet. Drifting on the conglomerate during the year amounted to 1938 feet at No. 2 shaft, and 3357 feet at No. 3 shaft. Drifting on the Osceola amygdaloid amounted to 1888 feet. Crosscutting amounted to 3660 feet. Total work of all kinds, 13,206 feet.

MONTANA.

CASCADE COUNTY.

The concentrator at Neihart will begin April 15. The main motor is a No. 7 Pelton, with two nozzles, capable of generating 450 H. P. This will run all the heavy

machinery in the plant, the power to be conveyed by manila ropes. Three other water motors, each a No. 3, will attend to smaller departments of the work. Two are for the operation of electric dynamos and a third is to run the tables.

GRANITE COUNTY.

F. D. Brown has men at work at the Hidden Treasure mines, Harvey Creek district. A mill will be built this season.

The Masculine, at Garnet, is under lease and bond to Helena men, who will develop it. Machinery will be put on.

The drift from the tunnel on the vein in the Buena Vista is in 3 feet of ore with an average value of $27 gold.

CARBON COUNTY.

Following are the requirements of the Red Lodge Miners Union No. 29, Western Federation of Miners, employes of the Rocky Fork Coal Co.: "We beg leave to make answer to the sweeping reduction of wages by said company, which is to take place on the 15th day of March, 1900, and submit for your consideration the following scale of wages to take effect on and after the 15th day of March, 1900: Whereas, the mining and shearing of coal by the present system of machinery being of no material assistance, but rather a great detriment to the mining of coal in the Rocky Fork coal mines, we demand that the price per ton be as formerly, to wit, 75 cents per ton. Or, if the present system is continued, $3.25 per day for machine runners and helpers, drillers and helpers, blasters and loaders. For the places working on the level, empty pit cars shall be delivered to the working faces and all loads removed therefrom by the company. Timber shall be delivered at the mouth of each room and track shall be laid to the working face, as formerly. All crosscuts in rooms under 6 feet, nothing; from 6 feet to 15 feet, $1.50 per yard; over 15 feet, $2 per yard for the whole crosscut. For turning rooms across the pitch, $15; turning rooms with the pitch, $7.50; No. 2 mine and No. 6, if machinery is used, $3.25 per day, the same as No. 4 mine, or, if under the old system, for all men connected with mining and shearing machinery, 90 cents per ton. Tracklayers shall receive $3 per day; tracklayers' helpers, $2.75 per day; timber men, $3 per day; rope splicers, $3 per day; drivers, $2.35 per day; team drivers, $3 per day; cage men, $2.85 per day; common labor in mines, $2.75 per day; all outside labor not less than $2.50 per day."

MADISON COUNTY.

The smelter at Twin Bridges is shut down to put in an electric plant. Mgr. Owsley says: "We are going to do business right or go broke."

SILVER BOW COUNTY.

The Anaconda Standard reports the sale of the Speculator mine to the Amalgamated Co. for $2,000,000. It has been clearing over $50,000 per month and there is considerable ore in sight. The Speculator has always been a steady producer. Although the product is mostly copper, the first-class ores run ten ounces of silver to the ton and carry a percentage of gold, which appreciably affects the total value. The first-class ore is sent to the Deadwood smelter, where it is treated by the Golden Reward Co.; the second-class by the local smelter. Much of it is sold directly to the reduction works. Over $100,000 has been spent in the past four months improving the plant. W. W. Wishon is Supt.; P. Sheean foreman.

TETON COUNTY.

The A. M. Esler M. & C. Co. will this spring build a concentrating mill, 100 tons daily capacity, in Swift Current mining district, under a contract to concentrate 400,000 tons of copper ore for $6 per ton.

NEVADA.

ELKO COUNTY.

It is stated that the expenses of the Dexter mine at Tuscarora for February footed up $13,000, and that the amount realized from the bullion output for that month was $7,600. The manager of the mine attributes the large expenses to dead work that had to be done, and says that after April 1 there will be a profit.

ESMERALDA COUNTY.

The Northern Belle Recovery Co. has been formed to work the tailings of the Holmes M. Co. at Belleville; capital, $500,000; directors for the first year, M. L. Elliott and M. L. McDonald, Santa Rosa, Cal.; W. Irelan Jr., A. H. Barendt, San Francisco; I. Blake, New York.

LINCOLN COUNTY.

(Special Correspondence).—Proceeding from Deer Lodge to Panaca, we pass down Spring Valley creek, through Round ranch, Conder canyon, and into the north end of Meadow valley, where the latter town is located. On reaching Spring valley we strike the grade of the old Pioche Railroad, which operated during the '70s between the mines at Pioche and the mills at Bullionville, a distance of about twenty-five miles. Relics of numerous mills are to be seen along the creek, which are pointed out as memories of better days. Near the head of Conder canyon a dam has been thrown across the channel, impounding a good-sized reservoir of water above it, used for irrigation purposes in the valley around Panaca. In passing through the valley named one is compelled to gaze in wonder at the diverse and remarkable formations exposed. The ledges of granite, porphyry, white sandstone, lime and chalk rock, in many places stained with green copper carbonates and in others with a red iron oxide, form features of unusual interest.

At Bullionville are thousands of tons of mill tailings, reputed to contain good values in silver and lead. At this point the Peck concentrator, rebuilt two years ago from some of the old mills at a cost of about $50,000, ran thirty days last year on these tailings, but apparently with poor success, as it has since been closed down, though it is in good repair and is kept in charge of a watchman. WASCOTT.

Panaca, March 7.

The 5-stamp mill and concentrating plant of the Dividend Co. at Como has started.

STOREY COUNTY.

The Comstock Pumping Association will pay the Risdon Iron & Locomotive Works of San Francisco the remaining installment of $5000 on the contract to drain the Comstock mines, the Risdon people having demonstrated that the water in the C. & C. shaft could be lowered with the hydraulic elevators the full 500 feet called for by the contract, provided that 200 miners' inches of pressure water could be furnished. The Virginia & Gold Hill Water Co. has notified the Pumping Association that it will be unable to supply as much as 200 miners' inches of pressure hereafter. The Risdon Co. will furnish throatpieces and nozzles for the elevators free of charge for one year, and subsequent drainage operations with these elevators will be conducted solely by the Comstock Pumping Association.

OREGON.

BAKER COUNTY.

Three miles from Granite, W. J. Larkins, Supt. Conger mine, has spent $100,000 in plant and development and expects to spend $50,000 more this summer. He has considerable good ore which is worked by the cyanide process.

During February at Sumpter 15,050 tons of ore were milled, of the aggregate value of $196,000; 166 stamps at ten mines were at work; 160 stamps and one 250-ton cyanide plant were idle. The total output does not include ore shipped by the Golconda to the Selby smelter at San Francisco or the returns from concentrates shipped by the Bonanza, Golconda, Columbia and Badger mines.

The Gold Hill mine, Weatherby district, will increase the capacity of the mill from five to twenty stamps.

LANE COUNTY.

The Bohemia Girl mining claim, Bohemia district, is sold by Hinds & Londstrom to Seattle men.

UTAH.

MORGAN COUNTY.

At Carbonate Hill the Mountain Laurel M. Co. has incorporated and will develop their property. J. S. Lewis, Ogden, is secretary.

TOOELE COUNTY.

Tribune: In a decision by Judge Cherry that court takes the position that the owner of a claim can make a discovery and location within the boundaries of a former location. The ruling was handed down in three cases that were recently tried in Tooele county, in which the Bunker Hill M. Co. at Stockton and F. J. P. Pascoe, W. Reynolds and J. Brande were defendants. The latter had applied for patents on the Ada and Ada No. 2, which had been located within the lines and boundaries of the Chief—which latter was an original location made by the defendants — whereupon the Bunker Hill Co. adversed them on the ground that the Ada locations were irregular. The decision is an instructive one, and the first ruling of the kind of which any knowledge is had locally.

UINTAH COUNTY.

At Vernal the Uintah Copper & Gold M. Co. has incorporated to work some claims in Red Creek canyon, ten miles west of the Jessie Ewing mines. The ore shows 3% copper, with small values in gold and silver. The formation consists of mica, schist, quartz and porphyry.

WASHINGTON.

FERRY COUNTY.

(Special Correspondence).—The Mountain Lion mill started dropping its twenty stamps on the 15th inst.; the first cleanup will occur April 5th. This mine, two miles north of the town of Republic, has three distinct veins, two of which have been explored. These two show a large amount of quartz of medium grade in gold values. One ledge—average width 10 feet, average value $15—has been developed by a drift at a depth of 300 feet. The main ledge at that depth has been exposed by a 400-foot drift, 10 feet wide, which, with the crosscuts run, show the ledge to be from 9 to 26 feet in width, with an average value of four ounces of silver and one of gold. A winze has been sunk to, and a double-compartment shaft raised from, the 425-foot level, and a small amount of drifting done on this level. The quartz is a pure milky white, very hard and brittle, and shows a banded or ribbon appearance, especially in the pay chute, where the quartz is full of dark-banded ribbons. The gold occurs more free and less finely divided than in the Republic and other mines a mile or two to the south, and in the new mill the process adopted is entirely different from any yet tried in this locality. Mgr. J. S. Wyatt expects to make a saving of 90% at an expense of $3.50 to $4 per ton mining and milling, as the ore bodies are large and the mill is as near automatic in all operations as is possible to make it. The treatment is a combination of amalgamation and cyaniding, both by agitation and percolation. The ore is raised through the double-compartment shaft by a 75 H. P. electric hoist, where it is dumped into an automatically operated tramway, which conveys it to the mill building below, 106x185 feet. Here it is received in a 500-ton bin, and from there the coarse goes to a 9x15 crusher, and thence, together with the fines, to a 200-ton bin; from this it is automatically fed to twenty 1200-pound stamps, which crush it to 30-mesh, and then, after passing over copper plates, it goes to four 5-foot Huntington mills, which crush to 60-mesh. After leaving the Huntingtons it is agitated for seven hours in 30-ton tanks, and then passes to eight percolation tanks, 24 feet in diameter and 6 feet deep, where it will remain from twenty-four to seventy-two hours, depending on the ore. Thence the solution is passed through the zinc boxes and the cyanide solution pumped back to a storage solution tank to be restandardized and reused.

Three properties of Republic Camp—the Golden Lion, Little 4 and Stray Horse—have entered into a contract with Keoh & Stone for several thousand feet of work in the way of diamond-drill prospecting. Results in this camp are considered questionable.

The largest deal ever closed on a property on the South Half of the reservation, if not in this State, was made yesterday when P. Clark of Spokane bonded from the Farr Bros. the Manila claim, lying about four miles west of the camp of Keller, for $200,000. It is a fine copper showing. A 70-foot tunnel at a depth of 50 feet shows a 40-foot ledge of copper-silver ore of a concentrating character, assaying from 3% to 10% and 20% in copper and concentrating as high as 8 to 1, with about three ounces of silver accompanying each per cent in copper. There is every indication of some stir on the South Half this coming summer, as Clark has the reputation of not taking a bond on a property unless it has good indications of making a dividend-paying mine, and his success with the Republic of this camp and War Eagle of Rossland has given him a strong following.

Republic, March 17.

SNOHOMISH COUNTY.

The Everett smelter will add an arsenic plant. Under the present system the arsenic passes out of the smelter smokestack. As soon as ore can be had from the mines at Monte Cristo the smelter will be run at full capacity.

FOREIGN.

MEXICO.

The new cyanide plant of the Minas Prietas Reduction London corporation at La Colorada, State of Sonora, will be in operation next month.

The Minas Prietas M. Co. owns a railway from Torres, 103 kilometers from Guaymas, on the London Railway, to their mines, twenty-five kilometers distant, which is in operation. The company holds a concession from the Mexican government to continue the railway 100 kilometers beyond their Minas Prietas mines to tap other mining districts and towns. By the terms of this concession the company is obliged to begin construction on this extension before June 10, 1900.

Two Republics: Six mining engineers, accompanied by Angel Caso, started for Toluca on Tuesday by the National, on their way to Zacualpam, to examine a mining combination consisting of the Alacran, Socavon de San Fernando and Providencia mines. These engineers represent a strong London syndicate, which is prepared to pay $4,000,000, Mexican currency, for the property if their report is favorable. The party came out from London expressly to examine these mines, which were extensively worked by the old Spaniards in the colonial days and have yielded millions of dollars. A memorandum of contract as to the conditions of the purchase was drawn up and signed before a notary in this city and a deposit on account has been placed in the Bank of London & Mexico.

RUSSIA.

Circulars distributed all over the Pacific coast convey the implication that American miners can go prospecting in Siberia. Transportation companies use specious means of working up business. It is well for miners everywhere to understand that, unless by special permission, they are not allowed to go to Siberia to mine. The following is official:

CONSULATE OF THE UNITED STATES OF AMERICA,
ST. PETERSBURG, Feb. 13, 1900.

SIR:—Your favor of January 15th is at hand. The order prohibiting foreigners to mine on the west coast of Siberia is still in force, and a special permit can only be had by some one with a strong personal influence with the Emperor, on whose special order they are issued. I send you under separate cover, registered, a French copy of the Russian mining laws. Very respectfully,

W. R. HOLLOWAY,
Consul General.

IMPERIAL RUSSIAN CONSULATE,
SAN FRANCISCO, CAL.,
March 16, 1900—No. 104.

In reply to your letter of March 13th, I will inform you that foreigners are disbarred by law from prospecting and mining on the Siberian coast and the island of Saghalien, except by special permission of the Ministers of Agriculture and of the Interior, obtained through the Governor-General of the Amour Territory. Faithfully yours, ARTZIMOVITCH,
His Imperial Russian Majesty's Consul.

SOUTH AFRICA.

Discussing the effect of the Boer war on Transvaal gold mining, the London Statist thinks that the industry will have to contribute the cost of interest and sinking fund on the part of the war expenses, provide for an armed force to keep order, and help compensate those whose property has been damaged. On the other hand, there will be removed an oppressive government to whose extravagance it has contributed an amount equal to 3% interest and 1% sinking fund charges on $200,000,000. The Transvaal government expenditure rose from $6,510,000 in 1893 to $18,510,000 in 1896–98, the increase being spent for armament. Huge reductions could be effected with the disappearance of the dynamite and kindred monopolies, lowering of railway rates and the influx of new capital under conditions of security. Under an efficient government the mining companies could save $1.25 per ton milled, or, on 8,000,000 tons a year, $10,000,000. In government administration there is possibly a saving of $8,000,000. Setting against these amounts the cost of military police and the interest and sinking fund of a loan above referred to, the net gain for the industry under new conditions should be $5,000,000 a year. A result of British supremacy would be for the mines a great widening of the area of the industry and a development of low-grade mines which it was formerly thought unprofitable to exploit.

Commercial Paragraphs.

AT Sutter Creek, Cal., Knight & Co. are building a hoist for the Baliol mine, which was recently sold to a German company.

THE Risdon Iron Works of San Francisco is to establish a large shipbuilding works. The company takes the plant and site of the Pacific Rolling Mills Co., giving 1500 feet of water front and thirty-two acres of ground. The new plant will include a large drydock.

A NEW hammer-sling device, invented by H. Schepers, for relieving the strain on arm and wrist in single-hand drilling, is placed on the market by the Rix Engineering & Supply Co., 519 Howard St., San Francisco. Letters from miners who have used it testify to its merit.

THE Jeanesville Iron Works Co., Denver branch, A. Middlebrook Mgr., report recent shipments to iron and silver mines, Leadville, of high-lift station pump; Congress gold mine, Congress, Arizona, mine station pump; Battle Lake, Wyoming, No. 6 sinker; Mexico, two 4″x8″ electric power sinking pumps. The Jeanesville office has a wire order from Mexico for one 5½″x8″ electric sinker.

Personal.

CHAS. HUMMIELL, of Chicago, says he has $50,000 to spend at Cape Nome in securing unoccupied ground.

G. M. HYAMS succeeds Marcus Daly in the management of the Anaconda and other Butte, Mont., properties.

R. H. POSTLETHWAITE AND A. E. C. KERR, the latter from Ballarat, Australia, are visiting the Oroville, Cal., gold dredgers.

S. T. MURCHIE of Nevada City, Cal., goes as Supt. Taylor mine, Gunnison county, Colorado. His son will be foreman of the mine.

BEN AND LEWIS WILLIAMS, formerly of Arizona, are in receipt in San Francisco, of a $700 cup given them by former associates in the Copper Queen mine.

W. S. KEYES, now at Butte, Mont., has been appointed delegate to represent the United States in Paris at the International Congress of Mines and Metallurgy, July, 1900.

THE Merchants' & Manufacturers' Association of Los Angeles, Cal., has appointed C. B. Boothe as their representative at the coming Transmississippi Congress, to meet at Houston, Texas, Tuesday, April 17, continuing five days.

J. B. GRANT, of the American Smelting & Refining Co., is at Durango, Colo., to take possession of the Standard Smelting Co., which has been bought by the trust. It may be operated as a roaster auxiliary to the La Plata, Colorado, plant.

PROF. JOSEPH LE CONTE is the accredited representative of the University of California at the International Congress of Geologists in Paris next September, Prof. Stringham at the Congress of Mathematicians and Prof. W. B. Rising at the Congress of Applied Chemistry. Prof. Rising will be a member of the international jury of awards.

Obituary.

JNO. G. MURPHY, of Denver, inventor of the Murphy process for the reduction of ore, died in New York City on the 21st inst., aged 48 years.

H. J. DE LAMER, a prominent Arizona miner and late manager Temple Bar placer mines on the lower Colorado river, died in San Francisco on the 22nd inst.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR THE WEEK ENDING MARCH 20, 1900.

645,918.—MEASURING INSTRUMENT—J. G. Hanks, Oakland, Cal.
645,901.—TRUSS—P. Madden, Soldiers' Home, Cal.
645,669.—LAMP CHIMNEY—J. F. McHenry, Hollister, Cal.
645,825.—VEHICLES—J. Nash, Dayton, Cal.
645,631.—FIRE ESCAPE—C. H. Shields, Spokane, Wash.
645,904.—CULTIVATOR—I. D. Stockton, Penrose, Cal.
645,841.—WASHING MACHINE—C. W. Thompson, Ontario, Cal.
32,360.—DESIGN—C. E. Pierce, Avon, Wash.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BORING DRILLS.—C. S. Stafford, San Francisco, Cal. No. 645,219. Dated March 13, 1900. This invention relates to boring and drilling devices. It consists of a stop, a drill spindle turnable therein, and mechanism by which it is rotated, a sleeve forming the lower end of the stop, and an internally threaded collar loosely turnable within the sleeve having its inner end formed with an exterior annular groove, and its lower end provided with an antifriction bearing for the sleeve. A screw or pin passes through the inner end of the sleeve and engages the annular groove in the collar to prevent end movement thereof. A brake piece is loosely seated in the sleeve and a screw for operating the same. A yoke is carried on the outer end of the sleeve below a brake screw, and a device is carried by the yoke to engage the work to be drilled. The operative devices consist of a beveled gear journaled and turnable upon the side of the stop, having outer and inner teeth, corresponding bevel pinions loosely turnable upon the ends of the sleeve, with lugs upon their adjacent faces, a two-part sliding collar loosely fitting the sleeve between the pinions having slots in its outer ends to engage either of the lugs upon the pinions whereby a varying rate of rotation of the drill will be produced.

WATER WHEEL.—S. J. Tutthill, assignor to Tutthill Water Wheel Company, of San Francisco, Cal. No. 645,221. Dated March 13, 1900. This invention relates to improvements in water wheels of that class in which buckets are disposed around the periphery and adapted to receive water delivered into them by a nozzle under a high head or pressure. In this class of wheels it has been customary to bolt the buckets separately upon the rim, but the gravel or gritty material in the water soon wears the buckets out and cuts off the nuts or bolts by which they are secured. In this invention a plurality of buckets are cast upon segments which are removably fitted to the periphery of the wheel or disk and the ends of the segments abut so as to make practically a continuous plate on each side, thus distributing the strain upon the securing bolts, and these bolts are covered and protected from the impact of the water. The hub of the wheel is also extended so that it covers and protects that portion of the shaft upon each side of the wheel which is in line with and liable to be acted upon by the jet of water from the nozzle. These parts are all formed in a plurality of sections so that any part may be removed and another substituted without destroying the whole structure.

Recently Declared Mining Dividends.

Dixie, Utah, 1 cent per share, $5000	April	1
Centennial–Eureka, Utah, $1 per share, $100,000	April	10
Plumbago M. Co., California, 6 cents per share, $11,400	April	5
New Idria Quicksilver Co., California, 10 cents per share and 10 cents per share extra	April	2
Napa Quicksilver Co., California, 10 cents per share and 10 cents per share extra	April	2
Ætna Quicksilver Co., California, 10 cents per share and 5 cents per share extra	April	2
Cripple Creek Con., Colorado, 8%, $160,000	March	24
Boston & Colorado Smelting Co., Colorado, quarterly dividend of 1½%	April	2

Catalogues Received.

Triple-discharge two and three-stamp mills, and the "Hula Hula" rocker are described and illustrated in the latest leaflets issued by the Parke & Lacy Co., 21-23 Fremont St., San Francisco.

In black and gold comes a 178-page catalogue from C. O. Bartlett & Co., 43-45 Center St., Cleveland, O., general furnishers of elevating, conveying and mining machinery, fully illustrating and describing their specialties. The volume will be sent anywhere, upon request.

Latest Market Reports.

SAN FRANCISCO, March 29, 1900.

SILVER—Per oz., Troy: London, 27⅜d (standard ounce, 925 fine); New York, bar silver, 59½c (1000 fine); San Francisco, 59½c; Mexican dollars, 48¾c.

COPPER.—New York: Lake, 1 to 3 casks, 16.75 cash; carload lots, 16.25; Electrolytic, 1 to 3 casks, 16.50; carload lots, 16.25; Casting, 1 to 3 casks, 16.50; carload lots, 16.25. San Francisco: 17½@18. Mill copper plates, 21½c; bars, 23½@25c.

LEAD.—New York, $4.72½; St. Louis, $4.72; San Francisco, $4.85; pipe 7½, sheet 8¾, bar 6½c. London, Soft Spanish Lead, £16 11s 6d.

SPELTER.—New York, $4.55; St. Louis, $4.55; San Francisco, ton lots, 6c; 100-lb lots, 6¾c.

ANTIMONY.—New York, 9½c; San Francisco, 1000-lb lots, 11c; 300 to 500 lbs., 12@14c; 100-lb lots, 15@18c.

BABBITT METAL.—San Francisco, No. 1, 10c.

PHOSPHORUS.—F. o. b. New York or Philadelphia, 50@55c ℔ lb.

SOLDER.—Half-and-half, 100-lb. lots, 21½c; San Francisco, Plumbers', 100-lb. lots, 18½c.

IRON.—Pittsburg, American soft—pig—large lots—$25.25; Scotch, $26.50; San Francisco, bar, per lb., 3½c.

The New York Commercial foresees a big break in iron prices and says: "Iron and steel prices, so long upheld by a big combination in this market, are on the verge of collapse, according to buyers of such prominence that their statements can not be ignored. A serious bear movement began quietly last Wednesday, gaining emphasis and insistence, and now some of the most prominent metal men in New York give credence to the Commercial's statement over their signatures. Many leaders in the movement for railroad and structural metal at cheaper prices admitted the bear combination, but preferred to let the other side do the talking. It is believed many of them have already received overtures for future delivery under market rates. On the other hand, steel and iron sellers meet the bear talk over their signatures to the Commercial. The president of the Federal Steel Co., Judge Gary, is quoted: 'I say that there is no possibility of the price growing less for the coming year.' Steel and iron producers lay a high price for finished material to an alleged basic price of $5.50 per ton for iron ore contracts up to July 1, 1901. This figure, they claim, is $3.15 higher than the cost of the same raw material one year ago. Continuing, the bulls point to $2 a ton more for coke, 45 cents a ton more for transportation of Lake Superior ore, a 35% to 40% higher rate of wages and a 50% to 100% increase in the cost of rolling stock. Buyers laugh at these allegations. They claim knowledge of a recent sudden increase in the private contracts at cut rates here and abroad."

STEEL.—San Francisco, bar, 12c to 20c per lb.

QUICKSILVER.—New York, $51.25; London, £9 14s; San Francisco, local, $51.50 ℔ flask of 76½ lbs.; export, $47.50.

PLATINUM.—San Francisco, crude, $16 ℔ oz.; manufactured, $19.50@22.00

FERRO-TUNGSTEN.—New York, 60c; San Francisco, 75c (60%).

MAGNESIUM.—New York, $3.50 ℔ lb.; San Francisco, $4.50.

ZINC.—San Francisco, 6c; slab, 6½c; bar, 8c.

TIN.—New York, pig, $32; San Francisco, ton lots, 1000 lbs., 34c; 500 lbs., 35c; less, 36c; bar tin, ℔ lb, 40c.

ASSAY LITHARGE.—San Francisco, 10c ℔ lb.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 40c to 50c.

NICKEL.—New York, 40@45c ℔ lb.

BISMUTH.—New York, ℔ lb., $1.80 50-lb lots; San Francisco, $2.50 to $3 lb lots.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

FUSE.—Triple tape, $4.35 per 1000 feet; double tape, $3.70; single tape, $3.45; Hemp, $2.55; Cement No. 2, $3.70; Cement No. 1, $2.95.

CANDLES.—Granite 6s, 16 oz., 40s., 12c ℔ set; 14 oz., 40s., 11c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 33@35c ℔ lb.; carloads, 30@31c; in 10-lb. tins, 40c; sulphuric acid, 1¾c ℔ lb. 66% B; soda ash, $1.60 ℔ 100 lbs. 58%; hyposulphite of soda, 2¾@3c ℔ lb.; blue vitriol, 5½@6c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.00; sks, 95c ℔ 100 lbs.; chloride of lime, spot, $2.35@2.50; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

COAL.—San Francisco coast, yard prices: Wellington, $8; Seattle, $7; Coos Bay, $5; Southfield, $7.50. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.50; Scotch, $8; Cumberland, $9; Cannel, $9.50; Welsh Anthracite, $12.50; Rock Springs, $10.05; Colorado Anthracite, $14.50.

WANTED.

A Rich Placer proposition, adapted to working by Railroad Steam Shovel, or Dry Land Excavator. Description, with price and terms, to receive attention must be accompanied by reliable reports and references.

SITUATIONS WANTED.

Wanted—A Position as Superintendent in a hydraulic mine by a miner who has had twenty years' experience. Best of references as to ability, honesty and sobriety. Address S. O. G., care of Mining and Scientific Press.

Mining and Metallurgical ENGINEER
DESIRES POSITION.
Had long experiences in gold and silver mines and reduction plants. Had charge of stamp mills and cyanide plants. Can furnish best of references. Address CYANIDE, care this office.

WANTED.

A competent and experienced Hydraulic Engineer capable of taking full charge of an extensive piece of work. Answer: Wrenn, California Hotel, S. F.

Wanted—Gasoline Engineer,
One who is a machinist preferred. Applicants state references and salary expected. Address M. M., care of this journal.

WANTED TO BUY,
Two or Three Saddle Tank Locomotives, 36-Inch Gauge, Porter or Baldwin Make Preferred. Must be in good condition. TORBERT & PECKHAM, Monadnock Block, Chicago.

WANTED.—A Second-Hand White Howell Roaster, also a Revolving Drier.
Must be in good repair. Address ARTHUR HENDEY, Agent, Copper Chief Mining Company, Jerome, Arizona.

SMOOTH-ON CASTINGS.

An iron cement in powdered form, for repairing leaks or fractures in steam or hydraulic work, applied by mixing with water; hardens quickly and expands in hardening. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

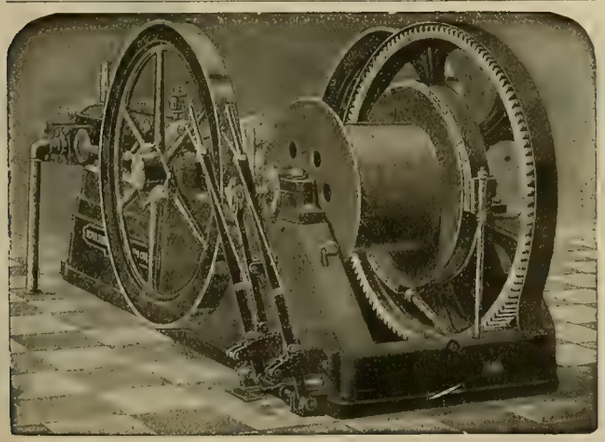
THE : CAMMETT : CONCENTRATOR.
Designed with some Regard for the Laws of Concentration.

From **The Denver Evening Post,** March 2nd, 1900.

"Empire, Colo.: **The success achieved** by the **Cammett tables** in handling the ore from the Maud S. mine, **an ore especially difficult to concentrate** on account of the **great variety** of its **metallic contents,** has given the Bonaccord mill a reputation that will firmly establish it as a safe plant for general custom work."

Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.



Denver Engineering Works,---Shepard & Searing,---Sole Manufacturers,
30th and Blake Streets, - - - - DENVER, COLORADO.

GATES FINE CRUSHER.

The result of ten years' solid work. Success at last. What we wanted, and the public demanded, was a Gates Gyratory Rock and Ore Breaker (always adjustable and indestructible) so modified in design as to make one-half-inch product from three-inch sizes, rapidly and cheaply. The H. Fine Crusher will do this work. It takes the place of expensive big rolls and often prepares ore, without further crushing, fine enough for coarse concentration or cyaniding. In any event, it is the greatest and best intermediate machine between the coarse breaker and the pulverizer.

Ask for No. 1 Catalogue. :: GATES IRON WORKS, Dept. UU, 650 Elston Ave., CHICAGO.

FAIRBANKS-MORSE GASOLINE-DISTILLATE GEARED HOISTER.

An efficient and reliable combination of a Fairbanks-Morse Gasoline-Distillate Engine on the same base with a Friction Hoist. Modern and up to date. We publish a special catalogue describing our Hoister which we gladly mail prospective purchasers.

FAIRBANKS-MORSE GASOLINE-DISTILLATE ENGINES.

NO. 3 LAMP.

McINTYRE'S DRY BATTERY

PORTABLE ELECTRIC SAFETY LAMP.

ABSOLUTE SAFETY is Assured All Users.

This is an Electric Lamp set in a White Enamel Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick-pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket. So the user has free use of hands. The current can be turned off when not in use. Dry batteries are used and can be recharged from direct Incandescent Electric Current. Charger and full directions go with each Lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Oil and Gas Works Employes, Powder Mills and Warehouses where explosive materials are manufactured and stored, where it is impossible to carry an oil lamp or candle for fear of explosion, and all parties requiring a safe portable light. The whole outfit is neat and compact.

No. 1 weighs 2 lbs., 1½ C. P.	Price complete, $4.50.	For meter reading only.
No. 2 " 3 " 4 "	" " 6.00.	For Miners and general use.
No. 3 " 1½ " 10 "	" " 12.00.	For several persons to work by.
No. 4 " 3 " 4 "	" " 6.00.	Boiler Makers and Chimney Sweeps.

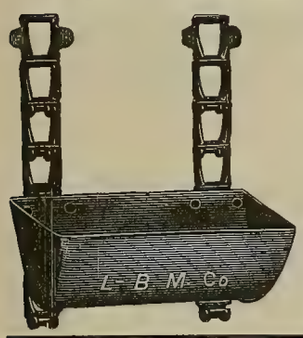
THE IDEAL CONVEYOR BELT



Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

MINERS, ATTENTION!

SCHEPER'S HAMMER SLING.

A Great Labor Saving Device.

THE above illustration of Scheper's Hammer Sling tells the whole story. It is seen at a glance that the weight of the hammer is carried on the wrist and forearm, by the sling, thus avoiding the firm and tiresome grasp necessary to hold the hammer in the ordinary method.

There can be no doubt that fully one-half the labor of using a hammer by the ordinary method is caused by the exertion of holding the hammer firmly in the hand to resist its weight and the centrifugal force of the swing. With the hand sling the hammer may be held perfectly loose in the hand and the fingers may be extended, as shown, and no grasp whatever made upon the handle, merely enough contact with the handle to preserve the direction of the hammer.

If a miner is so inclined, he may increase the weight of the hammer by at least 30% with scarcely any addition to the labor of using it.

This Hammer Sling is of the greatest advantage in the drilling of uppers, for it is this character of work that is ordinarily most severe; but it can be used with tremendous advantage in down holes.

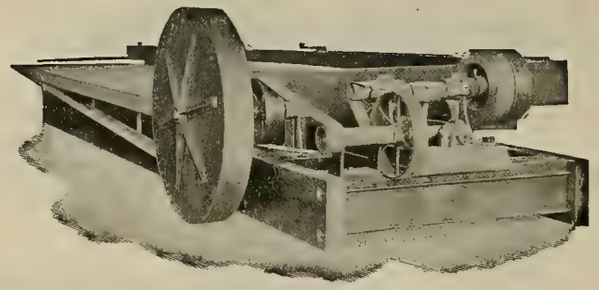
To attach the sling to the hammer it is only necessary to drill a three-sixteenths of an inch hole through the hammer handle, about one-half inch from the hammer, as shown in the cut.

The Hand Sling may be removed in an instant and replaced when desired. The whole device weighs but one and a half ounces.

Miners suffering from strained wrist and finger cramps from using ordinary hand hammers will find it possible to continue work by using the Hand Sling. **Retail Price, 50 Cts Discount to Dealers.**

RIX ENGINEERING & SUPPLY CO.,

MANUFACTURERS,.....519 HOWARD STREET, SAN FRANCISCO, CAL.



WHITE, ROGERS & CO.,

Contracting Engineers and Millwrights,

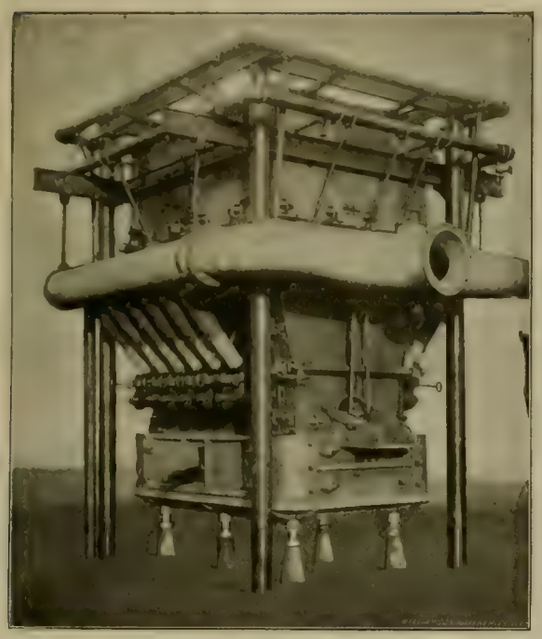
OFFICES, 306 PINE STREET, - - SAN FRANCISCO, CAL.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.



One of these machines will take the place of two or three belt concentrators of any style and do very much better work. Easy adjustment. Little wear.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

SEND FOR CIRCULARS.

These Machines are Kept in Stock Ready for Immediate Shipment.

A MODERN COPPER SMELTER.

THE COLORADO IRON WORKS CO.

ESTABLISHED 1860. DENVER, COLO.

—MANUFACTURERS OF—

Smelting Furnaces and Equipments

: : : FOR THE TREATMENT OF : : :

Gold, Silver, Lead and Copper Ores.

We build furnaces to drawings and specifications, and furnish drawings and full instructions for erecting.

We erect all furnaces at our works and carefully mark every piece before shipping. By this means, trouble in erecting at the smelting plant is entirely avoided.

We contract to build and equip smelting plants complete, of any required tonnage capacity above forty tons per day, at any desired location and put them into successful operation under guarantee. We contract to smelt a thousand tons of ore, more or less, before turning the plant over as completed under the guarantee.

We have in the past built more Blast Furnaces for smelting the ores of the valuable and the precious metals—gold, silver, lead and copper—than any other manufacturing concern on the American continent, and in the past year of 1899 we built more such furnaces than all others combined.

(SEE PAGE 364.)

GATES IRON WORKS.

THE TREMAIN STEAM STAMP MILL

has made many fortunes for its owners. It costs but little money. Can be transported anywhere.

CHICAGO, ILLS., Jan. 18th, 1900.

GATES IRON WORKS, CHICAGO, ILLS.

MY DEAR SIRS:—

Replying to your letter of the 17th inst., asking what we have done with the Tremain Mill at the Storm Cloud Gold Mines near Prescott, Arizona, in the past year, will say that we have been unable to run the Mill more than three days out of the week, owing to the fact that we have had, during the past year, but little rain. We were obliged to use settling tanks and save what little water we had, in order to run three days per week. The Mill has worked splendidly—in fact, it is a perfect little giant to do business with, where you have plenty of water for amalgamating purposes.

Enclosed I hand you a statement amounting to $20,210.72, which is the total product of the Mill for the twelve months, giving dates that we sent the bars to the mint at San Francisco and the amount we received for each bar.

I think the Tremain Mill is the best friend that a prospector or an individual who has practically a good mine can get hold of, to furnish him money to develop his property. I bought the Storm Cloud Gold Mines the last of June in 1897. In the fall of that year I bought, as you know, one of your Tremain Mills. From the day I started it it has paid all my developing expenses, and from the report made by the geologist of Arizona, December last, I now have $940,000 of ore blocked out, the expense of which has been paid from the net proceeds of the Tremain Mill. I have paid for over 1800 feet of development work with this Mill since I erected it two years ago last October. My experience teaches me that if anyone has any trouble with the Tremain Mill it is the fault of the man who operates it.

Yours very truly,

WHITING G. PRESS.

ASSESSMENT NOTICES.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of March, 1900, an assessment (No. 11) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 773 Mission St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of May, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 26th day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California.

SOUTH PALOMA GOLD MINING COMPANY, Limited.—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of March, 1900, an assessment (No. 2) of six-tenths (6-10) of a cent per share was levied upon the capital stock of the corporation, payable immediately to the secretary, John F. Barnett, at Room 22, No. 222 Sansome St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23rd day of April, 1900, will be delinquent and advertised for sale at public auction; and unless payment be made before, will be sold on MONDAY, the 14th day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOHN F. BARNETT, Secretary.

Office—Room 22, No. 222 Sansome St., San Francisco, California.

OSCEOLA CONS. MINING COMPANY.—Location of principal place of business, San Francisco California; location of works, Plymouth, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of March, 1900, an assessment (No. 9) of one (1c) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 307 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of April, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of May 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

HOLLAND SMITH, Secretary.

Office—307 Montgomery street, San Francisco, California.

CONSOLIDATED CALIFORNIA AND VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of March, 1900, an assessment (No. 15) of twenty cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room No. 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of April, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 1st day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room No. 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

ANNUAL MEETING.

The Regular Annual Meeting of the Stockholders of the Swin Mine Development Company will be held at the office of the company, Nos. 1208-11 Claus Spreckels building, San Francisco, California, on TUESDAY, the 10th day of April, 1900, at the hour of 2 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Saturday, the 7th day of April, 1900, at 12 o clock M.

J. J. CRAWFORD, Secretary.

THE LUNKENHEIMER Regrinding Swing Check Valve

Is much superior in point of excellence of material, design and workmanship to any other valve of its class upon the market. The body is heavy and well proportioned, the seat is carefully finished and the workmanship is first-class. This valve is so designed that when the disc is raised the passage through the body is fully equal to the diameter of the connecting pipes.

By means of the regrinding feature the usefulness of the valve can be prolonged indefinitely. When worn in the seat the valve can be reground without removing valve from connecting pipes.

Made in brass, medium and extra heavy patterns, screw and flange ends ¼ to 3 inches. Iron body, brass mounted, screw and flange ends 2 to 6 inches. All valves are carefully tested and warranted.

Specify "Lunkenheimer" make. Sold by dealers everywhere.

Nome Gold Separator.

The "Cyclone" gold separator and amalgamator, built by Wm. H. Birch, 129 First St., San Francisco, Cal., and illustrated herewith, consists of an outside cone of copper, spun with corrugations about ¼-inch deep. In the bottom of this cone is screwed an inlet or suction pipe, the diameter of which is regulated to the capacity of the machine. This pipe extends into the cone from 1½ to 4 inches, leaving a space around it for quicksilver and the clean-up. On the lower end of this suction pipe there is a metal coil to prevent the entry of any rock too large to pass through the machine. There is also an inside cone with two large outlets, either of which equal the diameter of the suction pipe. The rod to which the handle and gearing for working the machine is attached is screwed into the center of the inner cone. This cone has small lugs which slip under ear pieces attached to the outside cone, and thus, by the use of a small screw, the two cones are tightly locked together. Attached to each outlet of the inside cone is a grizzly, through which the finer material passes immediately on entering the machine from the suction pipe. The coarser particles that will not go through the grizzlies are carried up past them, and, like the finer parts, are forced by centrifugal action around the inside of the outer cone. By the time the material has traveled from the bottom to the top of the cones, the heavier particles, such as gold and other precious metals, are separated from the gravel and sand, the latter passing out at the top, the former remaining in the bottom of the outer cone around the suction pipe. By turning the handle which works the gearing, both cones revolve under water. The inside cone is supplied with a number of fans, which form compartments and separate the two cones. The water filling these compartments, and the action caused by turning the cones around by the aid of the gearing, causes a reversed whirlpool or suction, and by this method any material of the proper size that may come in contact with the suction pipe under water will be taken up and into the machine. The machine, with metal tubing enough to work in 6 feet of water, weighs thirty-five pounds; additional tubing weighs 1½ pounds per foot. Should the tank system of working be adopted, the entire outfit would weigh about 250 pounds. The manufacturers claim as an important feature of this device that, no matter what climate it may be used in, it can be worked throughout the entire year.

Works of the Champion Mining Company, Near Nevada City, California. (See page 377.)

Nome Gold Separator.

When the present oil excitement began this paper published two series of articles on oil formations, and oil lands in general, giving full up-to-date information concerning the California petroleum industry. The question of petroleum miner's rights, "scrip," and other matters now comes up, and, in accordance with its custom of supplying accurate information on such subjects, is begun in this issue an exposition of law and fact in such cases as now interest so many thousands of people. The article on page 373 is not an ex-parte statement, but is an impartial explanation of the question, clearly setting out present conditions and suggesting intelligent remedy for existing defects in mining procedure.

A Difference in Methods.

In our special correspondence this week some Nevada county, Cal., mines are mentioned that practically and specifically illustrate one phase of California gold mining, viz., that they "go down." Mines that were once "abandoned"—that is, unworked because of lack of profitable processes for the sulphureted ore that came in as depth was reached—are regular dividend-paying properties, workings extending in some instances to a depth of 2400 feet. With greater understanding of these facts the traveler along the axial mountain line of California should not be out of the thunder of dropping stamps from San Diego to Siskiyou, the entire 700 miles of the State's length. Many of these old mines, long idle, now alive with profitable activity, are held under original agricultural titles. Not all were idle. Some, such as the Empire, have a continuous gold bullion yield of fifty consecutive years.

It is sometimes said, by way of contrast, "Had the gold quartz mines of California been exploited as thoroughly and fearlessly as the Comstock, deep mining in California would have been proved to be profitable twenty-five years ago." That is to be qualified by two important facts: First, such gold ores in California could not have been profitably treated then; there was no such combination of process and facility that now exist; mining and scientific progress have made profit possible. Second, the methods were always different, and are to-day. In the old, great bonanza days men never before saw such daring, such audacious, expensive exploitation of mines as was manifested on the Comstock. But this was because of the way the money was furnished. On the Comstock money was always to be had by the hundred thousand dollars just by assessing the stock, and thus was made possible the deep mining there. But this deep mining was only secondary; the men who levied the assessments and those who paid them little cared as to the mine itself; it was the street that was being worked; it was all a gamble—stocks were the prizes won or lost, not development nor dividends. Men neither knew nor cared whether Ophir or Lady Bryan or Sierra Nevada had a shaft 300 or 3000 feet deep; whether the breast of the drift was in bonanza or borasca; all they saw or thought was the daily quotations at the stock exchange or in the brokers' offices. The magnificent result was deep mining, paid for by the public.

In Nevada county and elsewhere in California, so far as gold mining is concerned, the profits derived from one level were depended on to buy machinery and pay for labor in sinking another 100 feet, or run another drift. The mine had to develop itself; there were no assessments paid up, regardless of amount, while the stock was surging up and down forty points a day. It was mostly individual effort or private partnerships; and the results are as different as the methods that actuated them.

Values of Mines and Mining Stocks.

Reference is made in adjoining column to the avidity with which Comstock shares were seized a generation ago. In those days the value of the mine cut little figure in the street value of the stocks. Stocks sold at hundreds of dollars per share when the mining properties they represented paid no dividend, not even running expenses. Twenty-five years ago to-day—April 7, 1875—930 shares Bullion M. Co.'s stock were bought in the San Francisco Stock Exchange at $50 per share. The mine is still being assessed—No. 55 was the latest—and has never paid a dividend. No invidious reference is intended. The mine mentioned is merely typical of the way mining stocks went then. No one minded much, so there was a stock to play with.

In marked contrast is the present condition in the one lively mining share market to-day—that of Cripple Creek, Colorado—where the singular anomaly is presented of a higher cash price being paid in actual purchase of mining properties than the valuation of the stocks of those properties in the mining stock market. The Comstock mine stocks were manifestly too high; the Cripple Creek mining stocks are as manifestly too low.

There are several causes for the difference in mining stock market conditions past and present. The Comstock era was one of reckless speculation, a plethora of money and a general craze—the same frame of mind that now makes a man mortgage his home and start for Cape Nome—hope told a flattering tale, and men confused their dreams with static facts. Then, too, in those days were masters of mining stock manipulation. Not even Rhodes or Barnato outshone the old "bonanza crowd" of California and Nevada in ability to "boom" stocks. Again, in the old Comstock days there were cliques and combinations constantly clamoring for control of certain mines, and they kept prices up even of adjacent properties that profited by such contiguity.

Cripple Creek's mines are worth more than the market buying price of their stocks to-day because of lack of that warring element; because of cessation of speculative demand in the East; because of absence of such past grand manipulators as dealt the Comstock game; because of more active legitimate investment in mining property and development as a legitimate business proposition; because, too, the trend of the times is to hold possession of control in a more direct way than by the intermediary methods of the stock brokers, and, finally, because the increase of the value of the mines themselves outruns the belief of the outside buying public. The pendulum now swings the other way. The servant girls and clerks, the waiters and vegetable peddlers who bought Comstock shares, no longer invest their surplus money that way. Men who rightly understand the great value of Cripple Creek's gold mines are getting control themselves, and they don't do so much business with the stock broker. It is not so good for the stock broker, but, eventually, it means bigger sales of mining machinery, more men at work, greater mining areas discovered and developed, and more general prosperity for the State.

Gold Mining in Alaska.

Considerable inquiry comes regarding government requirements as to dredging for gold at Cape Nome and alien mining locations. Both matters are so mixed up by pending congressional action that, till the result of present legislation is announced, nothing of permanent value can be said. As to dredging, a government permit is required to mine at any U. S. point lying within three miles seaward from low-water mark. Such permit must be procured from Secretary of War Root, the War Department having jurisdiction over the navigable waters and coast line of the United States. Several such permits have already been granted, and more applications are on file. One license issued to a deputy auditor in the State Department—Geo. W. Easterly—gives him exclusive concession to operate dredgers 2000 feet outside low-water mark for a stretch of two miles along the Cape Nome coast. It seems to be a case of first come first served. Permits are only required of or by those who want to use mining machinery.

As to alien mining locations, the U. S. law is that no one not a citizen of the United States, or who has not declared his intention of becoming a citizen, can lawfully locate a mining claim in U. S. territory. Of course, it follows that any one making such location in ignorance or defiance of this law can not convey legal title to the claim, and any one buying such location under those conditions has no lawful claim to the property. This is not a State but a federal question, and Alaska being solely under federal jurisdiction, the matter is susceptible there of direct settlement. The present prominence of Cape Nome claims, by reason of the rush and the necessarily loose method of securing and transferring mining property there, makes the subject one of pressing present value to all interested.

There is now under discussion in Congress a bill which is muddling matters. All it does, so far as the copies of the bill received show, is to re-enact present legislation. Section 73 of this bill is the most important. It says:

Aliens shall not be permitted to locate, hold or convey mining claims in the District of Alaska, nor shall any title to a mining claim acquired by location or purchase through an alien be legal. In any civil action, suit or proceeding to recover possession of a mining claim, or for the appointment of a receiver or for an injunction to restrain the working or operation of a mining claim, it shall be the duty of the court to inquire into and determine the question of the citizenship of a locator.

But this is precisely what the present federal law prescribes. There are "protests" going forward to Washington from California and elsewhere against the passage of this pending bill; but the fact that there is at present a federal statute which prohibits aliens from locating mining claims, and makes illegal any claim or title acquired by purchase of such location, makes unnecessary the passage now of a law which only re-enacts this, and makes the "protests" of anybody against such work of superorogation.

It used to be said that "nothing succeeds like success." In mining nothing succeeds but success, and success depends largely on exact, technical knowledge subordinated to the interests and requirements of business where in actual practice with experience is applied the knowledge gained. The man who knows one or two things well is better fitted for mining supervision than the theorist who knows only a little on a variety of subjects. This is the age of specialties and specialists, and the "all-round man" is not in such demand as formerly. Thousands yearly go out of schools of one kind and another with their heads crammed full and their hands empty, and are not of as much use to themselves or the men they seek to serve as though they had better and surer grasp of fewer things and were thoroughly grounded in definite practical knowledge of that which they essay to do.

Usually whenever a new factory or shop or store or business office of any kind is opened, it means more competition, a probable lessening of price, a threatened curtailment of profit to others already established there in that line. 'Tis different with a mine. A new mine means more money; more customers for the merchant, the manufacturer, the farmer, the railroad; it means addition to the world's wealth, a creator of money and of business, a liberal buyer of labor and material. There is no rivalry in the sale of the product, no throatcutting competition to secure a customer. Nor is there a monopoly. The best producing mine may be duplicated without antagonism from other mine owners. And the miner is always a good cash customer, consuming the production of every other industry without competing with any other producer.

In the issue of the 24th ult. editorial reference was made to the strike of the machinists. Since then mutual concessions and wise counsels have prevailed, and telegrams to this paper during the week from prominent mining machinery manufacturers in Chicago say that the strike has ended, and that all the men have returned to work in the shops. Present orders and contracts made complications doubly undesirable, and it is of mutual profit to employer and employe alike that the recent differences have been satisfactorily settled.

Concentrates.

WATTS ÷ 746, or kilowatts × 1.34 = H. P.

OSMIUM'S SPECIFIC GRAVITY is 22.477; gold, 19.265.

A FOOT of fuse will burn from thirty to forty-five seconds.

A MILL SITE, when entered, must be shown to be non-mineral.

PEROXIDE OF HYDROGEN is an antidote for cyanide poisoning.

IN Michigan "a barrel of copper" is 900 pounds weight of that metal.

COLORADO is now the "Gold State," and Montana the "Silver State."

FEBRUARY, 1866, had no full moon; February, 1900, had no new moon.

3, 5, 1, 4, 2 is common stamp-drop succession in California in a 5-stamp mill.

FOR any number of copies of any current issue, whether 1 or 1000, the charge is 10 cents each, delivered.

WITH a head of 50 inches, 4½ cubic feet of water per minute will discharge through a hole 1 inch square.

THE bottom of the shaft of the Kennedy mine, Amador county, Cal., is 700 feet below the level of the sea.

PROBABLY as large a pay chute as any in California is that of the Gwin mine, Calaveras Co.—1400 feet in length.

IN law a vein or lode is not known to exist until after an actual discovery of the vein matter within a given location.

IN the second "Concentrate" in this column in the issue of the 24th ult., the word "side" should have been "end."

A COMPLETE illustrated original article on "Turquoise Mining in New Mexico" appeared in the issue of March 6th, '97.

NITROGLYCERINE freezes at 46° F., and giant powder, when not actually frozen, may become chilled, thus needing care and attention.

HOW TO LEACH a low-grade copper ore too siliceous to smelt was summarized in an original article in the issue of August 27, 1898.

NATIVE CRYSTALS of Michigan copper show about the same percentages of silver and iron that are found in refined electrolytic copper.

FROM 20% to 50% more water can be evaporated per pound of fuel with a well-arranged, clean boiler than with one that is badly scaled.

A PARTNER is not liable for the price of goods sold to his copartner over his protest and after notice that he would not be bound for same.

CRIPPLE CREEK, COLO., men think that the rapid consolidation of mining properties there will tend to do away with the leasing system.

SALT LAKE CITY, UTAH, miners are forming an independent smelter company. Their project includes works for the treatment of zinc ores.

ORDINARY yellow bar soap rubbed well into the threads of a pipe (the grease being thoroughly removed) will make a petroleum-tight joint.

WHENEVER tar is used for a mine cable linseed oil should be added to keep the tar from adhering, both ingredients to be mixed while warm.

DYNAMITE is 75% nitro-glycerine, 25% infusorial earth; "giant powder" is 36% nitro-glycerine, 48% nitrate of potash, 8% sulphur, 8% resin or charcoal.

THERE is no fixed law for determining the size of wire to be used in induction coils. The primary is made large enough to take the current it is proposed to use.

WHEN mineral is discovered on land already patented in good faith as agricultural land, the title of the owner to the mineral so discovered is not jeopardized thereby.

ALUMINUM and steel are of equal strength in ratio to their weight. A small percentage of copper in aluminum increases its tensile strength in proportion to its weight.

EACH patentee is liable to all prior patentees to the extent to which he adopts their principles of invention in making a device which embodies his patented improvement.

THE 8.7-cent gravel to the cubic yard in the North Bloomfield hydraulic mine, Nevada Co., Cal., produced a net profit of $411,589.27 out of a gross product of $1,435,680.47.

PROSPECTING and mining are permitted within Government forest reservations under regulations of the Secretary of the Interior. The Yosemite, Cal., reservation is not so open.

THE Empire mine, Grass Valley, Cal., has been worked continuously for just fifty years: it has produced nearly $8,000,000 and is now being worked at a depth of 2500 feet on the incline.

CARBIDE OF CALCIUM is perfectly safe to handle if no water comes in contact with it. To preserve it, use an airtight vessel with no outlet; any outlet will simply cause it to decompose.

ABOUT one-fifth of the debris in California rivers and bays is due to hydraulic mining: the remainder is mainly due to natural erosion, cultivation of the soil, settlement of the country, increased population, etc. Mining, however, is responsible for such cultivation and settlement; indeed, it is to be held strictly accountable for all of California's prosperity.

"WET" ore has a high percentage of lead or copper, say, 40% lead or 20% copper. "Dry" ore contains a much smaller percentage. Smelters rarely pay for less than 5% lead.

CHRYSOPRASE is a rare variety of chalcedony, and is of value. It is found in limited quantities in Tulare county, Cal., in Jackson county, Oregon, near Rutland, Vermont, and in lower Silesia.

AN aperture 12 inches high by 12¾ inches wide through a 1½-inch plank, with a head of 6 inches above the top of the opening, will discharge 200 miner's inches, each equal to 1.4994 cubic feet per minute.

FOR luminous paper: 10 parts water, 40 parts paper pulp, 10 parts phosphorescent powder—bought ready made—1 part gelatine and a part ditchrom, acid potash. Mix and coat article to be made luminous.

THE U. S. Land Department considers a placer location covering 160 acres as one claim, on the assumption that eight locations are united in that amount; on each, $500 of work must be done to secure patent.

"CONCENTRATES" is unable to recall cognizance of any known cases where only part of a charge of giant powder has exploded, leaving a part of the charge intact, which was exploded later with another primer.

IN a mining partnership any one of the partners can quit whenever he wants to. His responsibility for expenses incurred up to the time of his quitting must be determined by the nature of the agreement made.

CONCENTRATION of low-grade cinnabar ore is not ordinarily deemed effective or advantageous; reduction of such ore is not expensive; the cost is in the mining, and no method of handling it could lessen the latter.

AN ampere expresses the rate of flow of electric current. An ampere hour means a current flowing for one hour at the rate of one ampere. At 110 volts one ampere hour should mean two 16-candle power lamps for one hour.

POSSIBLE and sometimes probable loss in commercial assays for silver arises from silver remaining in the slag, absorbed by cupel or volatilized in the crucible, scorifier or cupel. Crucible assays are usually the least liable to such possibility of loss.

IT sometimes occurs with Eastern or foreign promoters that they prefer to place mines or prospects from new districts where less information is obtainable, that their claims or assertions may not be too closely questioned or successfully contradicted.

TIME was in Australia when a convict who discovered gold in New South Wales was rewarded by 100 lashes on the back. Now the Government buys cyanide patents and makes concessions to gold finders. It also has an executive department of mines and mining.

"ARTESIAN POSITIVE," as applied to wells, means one from which the water rises above the surface; "artesian negative," one in which the water does not rise to nor flow above the surface. "Phreatic" water is that nearer the surface and derived from absorption.

COPPER may be given the appearance of platinum by immersion in a bath composed of 1¾ pints hydrochloric acid, 7½ ozs. arsenic acid and 1½ ozs. acetate of copper. The article should be thoroughly cleaned before immersion, and left in the bath till it has the color of platinum.

CONTINUOUS possession of a mineral claim, with due compliance of law, for a period equal to the time prescribed by the statute of limitations for mining claims, in the State wherein such claim is situated, entitles the claimant to a patent in the absence of any adverse claim.

IT is not uncommon to use an iron open tank filled with water and connected with the water jacket of a gas or gasoline engine in such a way that a continuous circulation of water through the cylinder jacket takes place, the large surface of the iron tank being sufficient to keep the water cool.

HYDRAULIC mining as legally defined in California is mining by means of the application of water under pressure through a nozzle against a natural bank, but in general the term is applied to any form of mining in which water is used to remove or separate the ore or metal from its original site.

ADVERTISING California mining stock as "non-assessable" makes no difference. It is assessable, and stockholders are responsible for the amount of assessments on corporate stock held by them. The endorsement "non-assessable" on the stock certificates, written or printed, does not affect the question.

A SURVEYOR'S STEEL TAPE, if broken, can be readily mended by taking a piece of copper ¾ inch long, in width a little over twice the width of the tape, folding it around the joined ends of the tape and soldering it to them. A weak solution of muriate of zinc is used in connection with plumbers' solder and a blowpipe.

THE Bullion, Nevada, mine is a monument to the possibilities of the assessment system. The mine has been worked almost continuously for twenty-seven years. It has never paid a dividend, nor even running expenses. Upon the stock have been levied fifty-five assessments, the last being 5 cents per share, Sept. 20, 1899.

WHERE co-owners of an unpatented mining claim are advertised as delinquent on assessment work they have 180 days from the time of the commencement of the first publication in which to pay up. The usual wages in a mining district determine the value of days' work in doing necessary annual assessment work.

BADLY burned steel is not easily restored. If not too far gone, the tools might be heated to a bright red and allowed to cool in a mixture made as follows: Melt 500 parts tallow and 120 parts black pitch together, and while that is being constantly stirred, add gradually 375 parts pulverized sal ammoniac, 125 parts ferrocyanide of potash, 20 parts soft soap, and a handful of salt.

CHROME ore has been a California production for forty years. It is mainly produced in Tehama, Shasta and San Luis Obispo counties. Only ore carrying over 50% is worth working. It is worth about $10 per ton in San Francisco and is shipped round the Horn to the East where it competes with the duty free chrome from Russia, Turkey and the Black Lake district in Canada.

THERE is considerable difference between the specific gravities of Eastern oil distillates and those of California oils. Viscosity of distillate or reduced stock being equal, the gravities are from 5° to 6° B. lower in California oil fractions than in those of Eastern oils. Flash and fire tests are from 10° to 30° F. lower in California oil distillates than in Eastern distillates of the same gravity.

THE bursting pressure of steam pipes can be increased. With pipe over 8 inches in diameter, winding with $\frac{3}{16}$-inch copper wire almost doubles the bursting pressure. Steam pipes are now manufactured of copper of the thinnest possible gauge for the interior or core of the pipe, the body proper being composed of steel wire wound tightly around the core, and the interstices filled in solid with copper by electro-deposition.

IN the case of Hartman vs. Smith, 7 Montana, 19, the Supreme Court of that State held that "all that is necessary to make the claim of a mill site by the owner of a non-contiguous mining claim valid is the reasonable use and occupation thereof for mining purposes in connection with a mining claim. A mill site may be patented by compliance with the same requirements regarding survey and notice as are applicable to veins or lodes."

THE duty of stamps—that is, how much ore per stamp a battery will crush per day—is a variable factor in mill practise. It is not uncommon to have a stamp mill average five tons per stamp per twenty-four hours. The mill of the Baliol G. M. Co., Sutter Creek, Amador Co., Cal.—forty stamps of 1000 pounds each, 4-inch drop, 9-inch die, 102 drops per minute—has averaged 5.35 tons per stamp each twenty-four hours, for a month at a time.

IF an electrode of carbon surrounded by powdered carbon in a porous cup be immersed, along with a platinum electrode, in an electrolyte of sulphuric acid in a glass jar, it is possible to develop electricity without extraneous heat. Chlorate of potash is added to form peroxide of chlorine, whereby the carbon is oxidized and electricity generated of an electromotive force of 1.3 volts per cell, the current being about 0.4 of an ampere.

THE discoverer, owner or operator of a mining claim, to which he has a patent, has a right to follow the dip of the vein under agricultural or timber land if his is the senior title; that is, if his patent antedates the patent or possessory right of the holder of the adjoining agricultural or timber land; but if the patent to the agricultural or timber land is of a date preceding that of the mineral claim the owner of the latter has no such right.

IN June, '97, in the U. S. Circuit Court in California, in a case then decided, the Caminetti Act was held to be constitutional, and the Debris Commission was declared to have right to regulate "hydraulic mining." Nothing has occurred since then to warrant any assumption that if the constitutionality of that Act were again attacked by the Anti-Debris Association or any one else, that the decision of any court of competent jurisdiction would be different.

GOLD MINING is the one form of metal mining now unaffected by trusts, trade combinations, or even the usual law of competition or business rivalry. It occupies the unique position among the business industries of the world of being the one form of production where the customer seeks the producer, where there is no "overproduction" or "want of consumption," where the same price prevails as did thirty years ago, and where conditions make it impossible for any combination to control its price or volume of output.

WHEN putting up shafting it is well to take into consideration the load that will probably be put on each pulley, and the way in which it is fastened to the shaft, and, not only this, but the way in which the load is likely to be thrown on, for in many cases where pulleys are fastened on with set screws only, when a heavy load is thrown on suddenly, the set screws fail to hold, the result being a thread cut on the shaft which is of no special use to any one, but it prevents the pulley from being moved easily back into place.

DILUTED sulphuric acid has no action on silver, but the strong acid when heated is decomposed by that metal, giving off sulphurous acid and forming silver oxide, which passes into solution in the excess of acid as silver sulphate. If gold is present in moderate percentage, say not to exceed one-third of the whole, strong sulphuric acid will extract the silver and leave the gold as a granular brown sediment. Should, however, the bullion contain anything like one-half gold, the latter metal would protect the silver against acid attack, and the result would be failure.

Westinghouse Type "C" Induction Motors.

During the last two years great strides have been made in the application of alternating current apparatus for the distribution of power in factories, mills, mines and other industrial establishments.

The type "C" form of induction motor manufactured by the Westinghouse Electric & Manufacturing Co., in its wide and varied application in numerous industries, fully justifies the enviable reputation it has established. The largest size at present constructed is rated at 850 H. P. The illustrated engraving, Fig. 1, shows a 500 H. P. machine built for direct coupling, which is in operation at East Helena, Mont., in the plant belonging to S. T. Hauser. Two other motors of similar size have been shipped to the City of Mexico. A considerable number of smaller size, from 200 to 300 H. P. each, are employed in California and elsewhere for operating flour mills, elevator machinery, general shafting in factories and for other purposes.

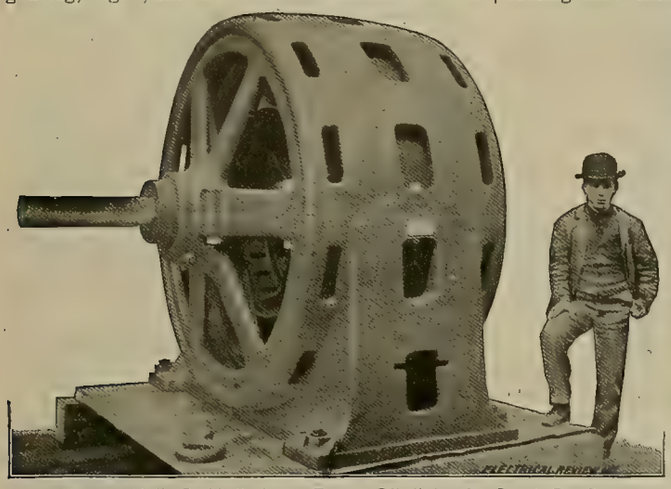

Fig. 1.—500 H. P. Westinghouse Type "C" Motor for Direct Coupling.

The department of the Westinghouse factory devoted to the construction of type "C" motors has been busily occupied in meeting the large demand for this class of machinery. Several new mills and factories will be entirely equipped with polyphase apparatus; and in many cases where additions are being made to established plants, old machinery is being abolished and Westinghouse type "C" motors substituted.

The type "C" motor is of simple construction, and approaches, on that account, more nearly to an automatic machine than some electrical apparatus. It has two main elements, the primary, directly magnetized by the current supplied from circuits; and the secondary, in which low potential currents are induced by the action of the primary. The windings of the primary are so arranged that when supplied with polyphase current, a rotating magnetic field is produced. This field acts upon the secondary winding and induces current therein, and rotation is produced. The revolving element in an induction motor may be either the primary or the secondary, but usually the primary is stationary and the secondary revolves. For purposes of comparison with a direct current motor the primary may be regarded as corresponding to the field magnets, and the secondary to the armature.

The primary element shown in Fig. 2, consists of a hollow cylinder built up of laminated rings of sheet steel, slotted on the inside to receive the conductors. The rings are rigidly supported by the cast-iron housing that encloses the primary and forms the frame of the motor. In motors of large sizes the rings are not continuous, but are made up of segments that are dovetailed and fitted into corresponding slots in a hollow cylindrical shell of cast iron, which is held in the cast-iron frame of the motor. The conductors are usually machine-wound coils of wire that are thoroughly insulated before being slipped into the slots of the primary iron core. In some of the larger motors copper strap bent into the proper form is used instead of wire for forming the coils. In large motors wound for low voltages, in which the large current requires a corresponding carrying capacity, a copper bar is placed in each slot; the insulated bars are slipped in at one end and the connections between bars are made by short lengths of copper strap. The terminal blocks, through which the leads supply current to the motor, are connected to the primary winding, and placed on the top of the motor, or in motors of large size, on one side.

The standard motors in sizes of ½ H. P. up to 200 H. P. are provided with a hollow cylindrical frame of cast iron, in which the primary is mounted, which forms a base for the machine and also supports two end brackets carrying the self-oiling bearings. Perforated iron plates fitted into these brackets protect the rotating element and permit excellent ventilation. They may be replaced by solid plates when it is desired to make the motor absolutely fireproof. It will be noted that the housing completely encloses the primary and the secondary elements and protects them from any external damage. Motors of large size are of the same general form, but the cast iron frame for holding the primary is made in two parts, separated horizontally, as shown in Fig. 1.

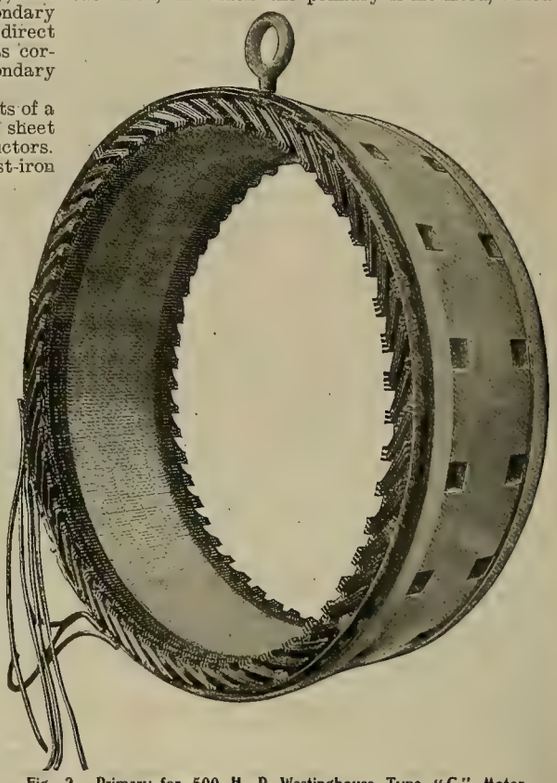

Fig. 2.—Primary for 500 H. P. Westinghouse Type "C" Motor.

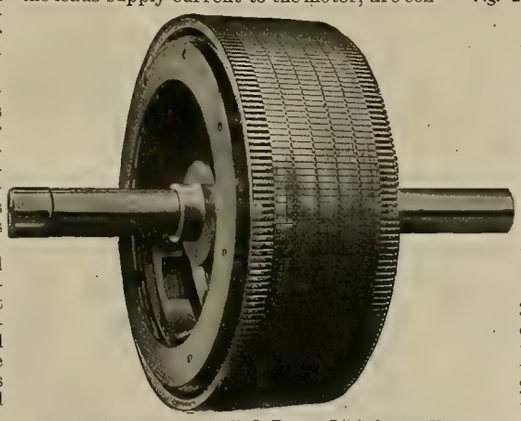

Fig. 4.—Armature for 150 H. P. Type "C" Induction Motor.

Type "C" constant speed motors are built for two-phase or three-phase circuits, for 7200, 3600 or 3000 alterations per minute. Standard voltages are of 200 and 400 volts for motors up to and including the 200 H. P. size. Those for 3 H. P. and less are also wound for 100 volts. The standard for motors above 200 H. P. is 400 volts. From 50 H. P. to 500 H. P. they may be wound for higher voltages, but it is preferable to wind them for the standard voltages,

Fig. 3.—150 H. P. Westinghouse Type "C" Induction Motor With Pulley.

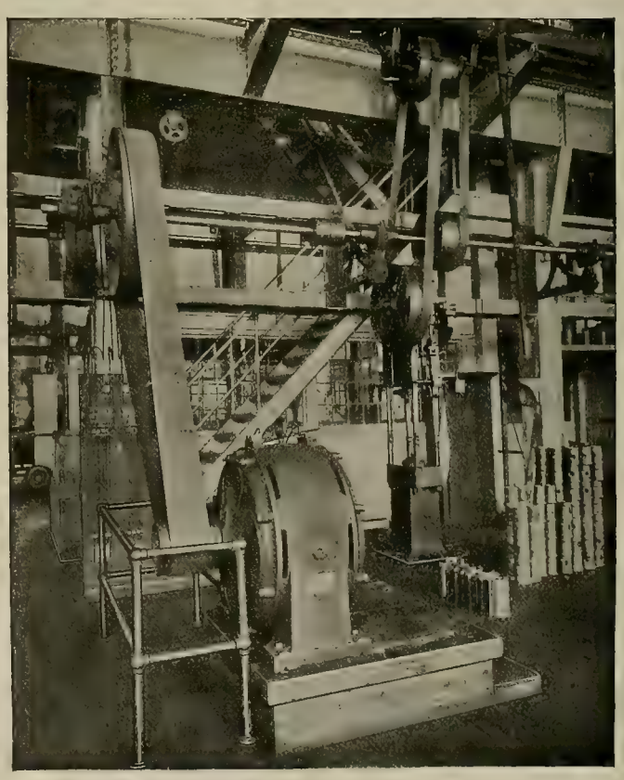

Fig. 5.—50 H. P. Westinghouse Type "C" Induction Motor for Driving Shafting.

as the wire is of much larger size than that which is used for the higher potentials, and in many cases the winding is made of copper bars or copper strap for the standards. Type "C" motors are also built with a variable speed for cranes, elevators, hoists and similar classes of work. The variable speed motor is almost identical in construction with the constant speed type, but is especially designed to give a different speed curve and is supplied with suitable regulating devices when necessary.

These motors maintain a high and almost constant efficiency from one-half load to a considerable overload. Motors are usually operated at considerably less than their full rated capacities; therefore, by maintaining a constant efficiency they secure an all-day or average efficiency very much above that heretofore possible with either direct or alternating current motors. The variation of speed between no load and full load is small, being less than that found in direct current motor practise.

On account of the absence of sparking and the safe and simple operation of type "C" motors, they have been largely introduced in grain elevators, powder mills, woolen mills, and other places, where they are exposed to inflammable gases and explosive material. For such installations the starting devices may be placed at a point more or less remote from the motor. This feature is also of value when motors are suspended from the ceiling or installed in some places not easily accessible.

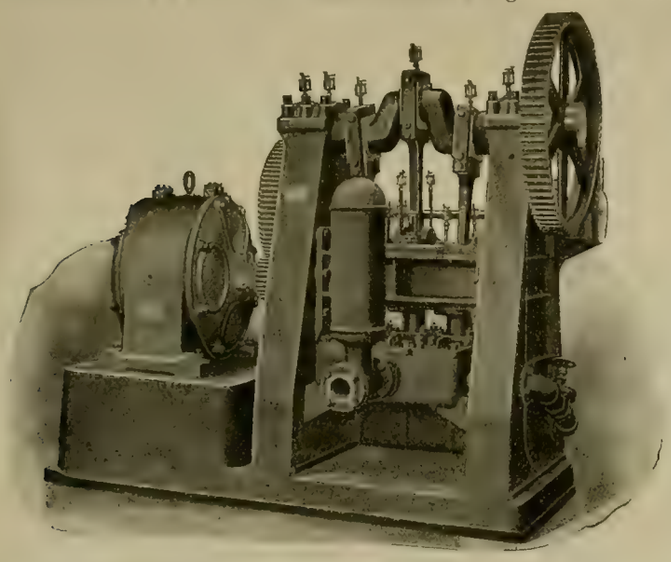

Fig. 6.—50 H. P. Westinghouse Type "C" Induction Motor Direct Connected to Pump.

Two Westinghouse type "C" motors have recently been dispatched to Paris, each of 850 H. P., which will be put in service to operate a moveable platform three miles in length, now being constructed in the Exposition grounds. These are believed to be the largest induction motors in existence.

The Golden Age of Science.

Above and beyond any particular gift of science—a new chemical element, a ray of new penetration, or even a new rule of physical and chemical action—there has been evolved something more and greater during this wonderful century: nothing else than perfecting the instrument by which discovery carves its path and particular rules are merged into universal law—the scientific method, now confessed the one trustworthy means for the winning all truth. Beginning in the comparatively simple sphere of natural science, it has passed to the more difficult fields of art, history, and criticism, to reforms social and political, moral and religious. In all its work, whether it has to do with the mere machinery of the livelihoods, or with the things of the mind and heart, the conscience and the will, it means reality, accuracy, fidelity to the directly observed and carefully comprehended fact. It disregards traditions, legends and guesses, however closely associated with great names or hoary institutions. In their stead it is erecting a new authority, which finds its sanctions in knowledge, in observation, experiment, reasoning, in untiring, impartial verification. When it gives play to the imagination and offers a conjecture in the hope that it may be helpful, the conjecture is plainly labeled as such, and is withdrawn the moment that a sound objection so demands. The man of science ever rejoices when he finds, as he often can, that men of old had a forefeeling of modern scientific truth; but, under all circumstances, he fully declares exactly what he discovers, however much his disclosures may cause a valued heritage to be disprized. Triumphs to us inconceivable doubtless await the centuries to come, but there will remain as the inalienable glory of the nineteenth that to the old question, "What is truth?" it first gave, not the old answer, "Whatever has been so considered," but "Whatsoever can be proved."

Scrip and the Law of Title to Oil Lands.

Written for the MINING AND SCIENTIFIC PRESS by A. H. RICKETTS.

The term "scrip" as used in connection with land matters may be defined as a writing issued by the Government certifying that its holder is entitled to as many acres of agricultural land as may be therein stated. The title obtained to land by the use of scrip is conditional until patent issues and, as a rule, is transferable, or practically so. Proceedings to secure the fee simple title for land upon which scrip is laid are initiated in the United States land office for the particular land district in which the land sought to be secured may be situated. An appeal lies from the decision of the local land officers to the Commissioner of the General Land Office, and from him to the Secretary of the Interior. The issuance of scrip is always authorized by an Act of Congress, and is generally intended to facilitate an exchange of lands between the United States and the individual or persons to whom it is issued. That is to say, the Government takes certain definite, ascertained tracts and gives to the scrip holder in return therefor the right to select other lands of the public domain which are non-mineral in character in lieu thereof, without any act upon his part as to improvement, residence and so on thereon. In some instances the selection may be made on either surveyed or unsurveyed land, and in some cases only upon the former. That depends upon the provisions of the particular Act which authorizes its issuance.

Scrip is known by different names—for example, Valentine scrip, Porterfield scrip, Sioux scrip, Soldiers' Additional Homesteads, Agricultural College scrip, etc. It has different values in the market, due to its scarcity or the rights which may be secured under it. Valentine scrip was quoted at from $50 to $60 an acre prior to the passage of the Act of June 4, 1897, which Act allows selections in lieu of surrendered lands within forest reserves. That Act grants the right of selection on either surveyed or unsurveyed land, and hence robbed Valentine scrip of its chief value; since then there has been no market price for that scrip.

Porterfield scrip is of limited issue, but it acquired enormous value, running from $100 to $125 an acre, because it was the only known scrip that could be used to locate townsites. There is but little of it in the market and there is no definite quotation.

Sioux scrip was originally issued to compensate the Sioux Indians for land ceded by them to the United States. This scrip could never be practically located by any one except the Indians, but by means of powers of attorney speculators used a large quantity of it. The price ranged at different times from $5 to $20 an acre. This scrip is practically out of the market.

Soldiers' Additional Homestead scrip has been much used by land speculators. This scrip was issued under an Act by which soldiers who had failed to perfect title to the full amount of 160 acres were allowed the right to select a sufficient quantity of land to make up the complement, and, being assignable, was bought up in large quantities by speculators. The price ranged from $2.50 up to $20 an acre at different times. There is still considerable of this right being sold for from $4 to $6 an acre.

Agricultural College scrip was issued to the different States in large quantities, but could only be used on lands which were offered for public sale or by preemption or homestead claimants in making payment for their lands. The price, therefore, was always less than $1.25 an acre. This scrip is practically exhausted.

There are other classes of scrip, but the foregoing are the most important.

Under the Act of June 4, 1897, commonly called the "Forest Reserve Law," and which has led more than anything else to the present agitation in land selections, it is provided, "That in cases in which a tract covered by an unperfected bona fide claim or by a patent is included within the limits of the public forest reservation the settler or owner thereof may, if he desires to do so, relinquish the tract to the Government and may select in lieu thereof a tract of vacant land open to settlement not exceeding in area the tract covered by his claim or patent."

Here, no provision is made for the issuance of any scrip. Therefore, the term "scripper" is a misnomer when applied to one who exercises such right of selection; that appellation is also with equal inaccuracy bestowed on one exercising a homestead right or one making a State lieu land selection.

In order to effect the exchange of lands authorized by the forest reservation law the settler or owner of lands therein seeking to exercise such right duly executes a deed thereof to the United States, causes the same to be recorded in the office of the proper county recorder, and thereafter with the evidence of its recordation duly endorsed thereon, files such instrument in the proper local land office accompanied by a full and complete abstract of title of his holding in the reservation sought to be exchanged and his application to select certain other land of equal area chosen by him as a fair exchange with the Government. These documents are accompanied by an affidavit showing the land selected to be non-mineral in character. There is perhaps nothing to preclude the transfer of lands within a forest reserve from one person to another, nor to limit the amount of such lands which any party may obtain by purchase and exchange the same for land lying elsewhere. Rights within the forest reserves are at present sold for about $4 to $5 an acre and are in great demand, as it is believed by many that the right of selection being exercised as above stated, the title immediately vests in the selector or "scripper," and this particularly when the land selected is shown upon the land office records to be agricultural land. Possibly, this may be so where patented land is the basis of the lieu; otherwise, perhaps, no more than a preferential right of entry can be obtained by such action.

The forest reservation policy is of comparatively recent origin, the first effort in that direction being an Act of Congress of September 25, 1890, reserving seven townships in Tulare county, followed by the Act of October 1, 1890, creating what is known as the Yosemite National Park, embracing about forty townships in Tuolumne and Mariposa counties.

On March 3, 1891, Congress passed an Act authorizing the President of the United States to create any further reservations when deemed necessary, and under this act President Harrison reserved immense bodies of land on the slopes of the Sierra Nevada, San Gabriel and San Bernardino ranges of mountains. Just before President Cleveland retired from office he made reserves including the western slope of the San Jacinto mountain, in Riverside county, and extended the reservation still farther north on the Sierra Nevada range. These reservations in terms included all of the land within their exterior limits, excepting only those to which title had passed which would have the effect of preventing any further prospecting or development of the mineral resources worked therein. This condition very justly alarmed the miners, and many protests were sent to Washington against these reservations. This agitation led to the passage of the Act of June 4, 1897, in which it was declared that as to the reservations already created and those that might thereafter be set aside (which, of course, includes the Lake Tahoe forest reserve), it was not the purpose or intent to authorize the inclusion therein of lands more valuable for the mineral therein or for agricultural purposes than for forest purposes, so mining may still be conducted and farms maintained within such reserves.

It was not until November 15, 1899, that any rule of the land department existed requiring the character of land selected under the law of June 4, 1897, in lieu of land within the forest reserves to be subsequently inquired into. The existence of that rule may be attributed to the recent agitation regarding oil lands within this State with which all newspaper readers are familiar.

Theoretically, this rule is favorable to the miner. Its promulgation was forced upon the department because it appeared that the majority of applications for title to lands under the law last mentioned were for lands marked "agricultural" upon the townsite plats, and it was necessary for the public interests and to prevent the absorption of the mineral oil lands as agricultural land through the instrumentality of insufficient returns of the character of such lands, as shown by the records of the land department.

Its effect is hampered, however, by the rule requiring that the land selected be shown to be more valuable for mining than for agriculture by the actual production of mineral and allowing the miner no certain time in which to demonstrate that fact. It is to overcome this condition that Congress is now being asked to enact a retroactive law by the miners of this State.

Any competent person may avail himself of the benefit of the Homestead Act by making proper application to the local land office in which the land he seeks to appropriate is selected. This right is limited to 160 acres and withdraws the land from the public domain for the period of six months without further act on the part of the applicant. This is not a popular way of acquiring land for speculative purposes, as the perfecting of the title requires settlement, residence and cultivation. No patent issues until the expiration of fourteen months from the date of the entry and that period may be extended to five years as the homesteader may elect, but until patent issues no part of the land can be legally alienated except for public purposes. In addition to the non-mineral affidavit required in other cases the homesteader must show that his entry was made for the purpose of actual

settlement and cultivation and not either directly or indirectly for the use or benefit of any other person.

Under the Act of Congress passed in 1853 every sixteenth section and thirty-sixth section of the public lands not wholly or in part mineral were granted to the State of California for school purposes. The title passes to the State when the land is surveyed without any other action of the land department. Whenever the land therein is or is found to be mineral in character, previously disposed of or within a prior grant, the State has the right to select elsewhere the number of acres lost to it because of such fact. This selected land is called "lieu land" and the right to make the selection is sold by the State to competent persons at the uniform rate of $1.25 an acre, but the market price is about $4 an acre. Lieu land selections are, however, practically exhausted, for want of a basis upon which to predicate them. The proceedings to obtain title to such lands is initiated by filing a proper application in the State land office at Sacramento. The selection must be approved and "listed" to the State by the United States Land Department at Washington before patent will issue from the State. The listing of the land to the State is equivalent to the issuance of a patent to it. The right of selection given by the State to any one person is limited to 320 acres for cultivable lands and 640 acres of uncultivable lands, but as little as a fractional part of an acre may be procured. The person making the selection is required to show that the same is entirely for his own benefit and that the land is non-mineral in character, mineral lands being excepted from selection. In cases where it appears that a part of the land covered by a lieu selection is mineral a segregation survey of the land, as it is called, is ordered, and the mineral portion of the land is excluded from the selection.

It will be seen from the foregoing resume that the forest reserve law furnishes the most prolific source of present trouble to the petroleum oil miner.

The term "scrippers" is not sanctioned by the lexicographers, but is probably as good as any other that could be devised. Its appearance was contemporaneous with the initiation of the present conflict between the different sets of claimants to lands lying within the petroleum belts of this State and situated within the public domain. It is applied to all persons who seek to acquire an agricultural title to such lands as non-mineral in character under rights, more or less inchoate, arising under general or special laws of the United States affecting the disposition of the public domain to private parties as agricultural lands, as well as to parties making State lieu land selections.

The word "scrippers" is used generically in this State as distinct from that of the term "oil miners," which latter comprehends all persons who seek to obtain title to lands valuable for petroleum or other mineral oils under the mining Acts of Congress. Both classes of claimants may be said to be indigenous to this coast, as the question of ownership of such lands which arises between them does not exist in the older settled States, or, for instance, in the city of Los Angeles, where the oil wells are situated upon lands which had previously passed into private ownership. Such question is only possible where both parties seek to divest the Government of its title to the same portion of the public domain under the different laws provided by Congress for that purpose.

Congress has divided the public domain into two great classes of land—agricultural and mineral; and the mineral lands are subdivided by it into two classes of mining claims, viz: lode and placer; the character of the deposit and not the manner of its working determining its classification. Congress has promulgated different systems of laws for the acquirement of each class of public lands by qualified persons, and empowered the land department to formulate rules to carry out the purposes of the Government.

(TO BE CONTINUED.)

The Chinese and the Telephone.

In circumstances where the telegraph is debarred from the direct conveyance of word symbols the telephone enters with peculiar value. Until Prof. Bell perfected this invention a Chinese was denied by the structure of his language any immediate transmission of it by electricity. Chinese has no alphabet, and its written signs are so numerous and intricate as to defy reduction to a simple telegraphic code. Two methods proffered themselves—first, to translate a Chinese message into an alphabetical tongue, telegraph this, and at the receiving station run the risk of error in retranslating into Chinese, or, in the original Morse method, giving a number to each word in a dictionary, and telegraphing numerals, to be matched as received with their appropriate signification.

With the telephone all this hazard and trouble vanish at once. A Chinaman speaks his message; it is received exactly as spoken, either by his correspondent or his correspondent's scribe. Louis Glass of the Pacific Telephone & Telegraph Co., San Francisco, states that his company has a substation in San Francisco, employing three Chinese attendants. "Their ejaculatory language gives peculiarly good telephonic results. The Chinese do a very large long-distance business throughout the whole Pacific coast, and apparently with more satisfactory results than English-speaking subscribers."

The Evil Practise of Ore Stealing.

Correspondence Denver, Colo., Post: Sooner or later all the mines that produce ore of more than average grade are obliged to consider the question of ore stealing. The greatest loss is not sustained, as one might imagine, from the bandits who raid the ore bins, burglarize ore houses and even invade shaft houses and hold up the top men while the mineral is being taken. Such robberies are costly enough, to be sure, but they pale into insignificance beside the constant leakage that results from the abstraction of rich specimens by the miners themselves.

The miner who breaks the gold-laden quartz, the trammer who takes it to the surface and the ore sorter who classifies it are all subject to the same sort of temptation that presents itself to a street car conductor without a register. If anything the conductor's temptation is the least enticing, for he works in public, while the miner is alone with the gold and the tempter for hours at a time.

At first it is just a little specimen to exhibit to wondering spectators. Then a few more specimens to distribute among solicitous friends. All this is so easy that the miner amuses himself by picturing in imagination the things that might be purchased and enjoyed with the money represented by a ton of the rock he is handling. Perhaps he calls to mind a pretty house that some other man has built with the proceeds from contraband ore. Then he makes inquiries and learns of a safe and comfortable method of disposing of the mineral if he should decide to take some.

The day comes when he puts a few handfuls of the pay streak in his pocket or dinner pail. He conceals it at home and goes back on his next shift in fear and trembling, half expecting that the whole mine will be ringing with the news of his pretty larceny. But it isn't, and when he finds that everything is going on as usual his courage returns, and he continues to add to his store until he has enough ore to make a private shipment. There are men who make a business of buying this sort of shipments. Some of them pose as assayers and other as legitimate ore buyers. Any of these people will pay half the real value of the shipment, and if the seller is very determined and very bold he may get a little more.

It should not be assumed that this is the experience of all miners, for there are hundreds of them who would not steal and who call such a traffic as this stealing. And there are other hundreds who do not work in high grade ore, and therefore find honesty not only the best but the only policy possible.

The men who have forced themselves into silent partnerships with their employers usually consider themselves honest, and they probably would be if they had not become the victims of temptation and the slaves of opportunity. Some of them justify their conduct on the highest ethical grounds.

The writer has heard of mines in Cripple Creek district where every man from the superintendent to the muckers went over the rock and picked out what happened to strike his fancy. Cases where such examples have been set by those in authority could be named by the score. It is no wonder that some of the mines have received beggarly returns on ore that assayed in the pictures.

The owners and lessess soon discover that this pilfering is going on, but generally submit and say nothing while the loss is moderate. They realize that the separation of the honest from the dishonest in an impossibility, and they hesitate to make the innocent suffer with the guilty, beside a new force would in all probability be as bad or worse.

But when the "graft" is overdone the management either discharges all who are suspected or tries a system of espionage. The Independence, Stratton's great mine, has tried both. A few months ago one whole shift was "fired" without notice. That this did not have the desired effect is shown by the rule established recently that all the underground employes must change their clothes at the mine under the eye of a "boss" when they come off shift. At first glance such a system would seem to be perfect, but there are many mine owners who would rather face the loss than to adopt it, for it has a tendency to make every man a thief. To an honest man the best stimulant to honesty is confidence. The search system proclaims that every man is suspected, and a natural instinct impels every suspect to "beat the game." Men will take ore to outwit the management who would never have thought to take it for pecuniary profit. Men who would consider it a crime to steal when they went forth unsearched will look upon a successful passage of the blockade as a praiseworthy exploit. All this may not be true at the Independence, but those are some of the reasons why the search system was not long ago adopted at all the high grade mines in the district.

The problem is not to prevent ore stealing—that would be a ridiculous effort—but to keep it at a minimum.

Victor Colo., March 24.

Testing Gold Dredging Ground.

TO THE EDITOR:—I note the very interesting article in your issue of March 10 on the subject of "Testing Gold Dredging Ground," and observe some criticisms of certain statements made by me on the subject published in your issues of January 27 and February 3. May I have the privilege of a few remarks in reply?

In giving the weight of the light horse power prospecting outfit at 1000 pounds reference was, of course, only made to the machine and power. Neither the piping nor drill stems nor other loose and variable appliances were included. I will simply add that such an outfit has been in existence for nearly a year, and has done excellent work. It is anything but a toy.

The suction or vacuum sand pump is a desirable improvement on the plain pump, but I have not found that greasing the outside of the drive pipe interferes with saving the gold. If it did, it would indicate either that too much grease was used or that some material outside of the normal field of the pipe had been driven into it.

In a majority of cases assumed dredging ground is the property of miners, and is so located that transportation of machinery to it is expensive, and sometimes almost impossible without the construction of costly roads. There is, therefore, a genuine and extensive demand for a machine of light construction that will enable the miner to test such ground. He rarely has $1500 to invest in a tool that will weigh 10,000 pounds, and may cost $500 more to land on his property—and after that will require fuel and skilled attendance. But he can often rustle $500 for one that can be driven by a horse whim and operated by himself and partner.

Again, the holes to be sunk in the majority of cases will not average over 20 feet in depth, and will be practically all in soil and gravel. Surely a job of this kind need not require the investment of $2000 in a prospecting plant.

The prospecting of auriferous gravels is an entirely different kind of a job from well sinking in rock. Machines that will do rapid work are not necessarily the best for the purpose, for experience has shown that the vital point of the whole operation of gravel testing with a driller is to keep the shoe of the pipe always a shade ahead of the drill. Now, the principal feature of a certain style of horse power drill is that it is far more comfortable and easy for the operator to drive his pipe than to drill, while with most, or perhaps all, of the steam power machines the drilling is made such a simple and easy feature that, unless the man in charge of the test is continually on the watch, the bit is always in advance of the shoe, and as a result either some of the material that should be brought up is driven outside the field of the pipe, or, if pumping is frequent, a considerable quantity of material from the outside is brought in. In either case the sample is vitiated. Nor, to my mind, is a machine that will "go through anything" of necessity the most desirable for gravel prospecting; for if the ground is very full of large boulders it had better be abandoned at once. The quicker you turn it over to some other fellow the better off you will be. A little machine will show the presence of boulders just as quickly as a big one, and at less cost.

When alleged dredging property in a tract of considerable size is owned by or under the control of a wealthy corporation, and the question to be decided is not whether the land has payable value, but what the average value is, then a heavier, more costly and specialized machine is distinctly in order; and if the topography of the region and the claim will permit it steam can certainly be substituted with advantage for horse power. But to put an elaborate and expensive driller upon a piece of untested dredging ground seems to me as great a mistake as to build a 50-stamp mill to treat the ore that may come out of an undeveloped quartz vein, with only a 10-foot shaft upon it. THEO. F. VAN WAGENEN.

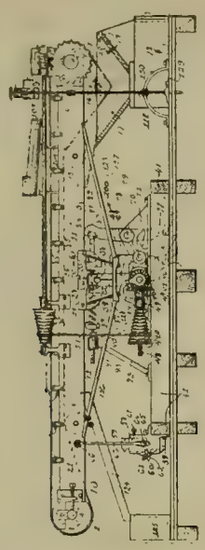
Denver, Colo., March 25.

Compressed Air for Rock Drills.

The following table is intended to show the approximate quantity or volume of free air required for operating rock drills, the air being delivered to the machine at sixty pounds pressure. These figures are necessarily approximate only, owing to the varying conditions under which each work is performed; but they will be found to apply closely to average conditions in rock of moderate hardness. A liberal allowance has been made above the actual requirements of new machines, to provide for wear, etc., but of course no allowance is made for leaky pipe, as this should not be permitted to exist. In soft material the actual drilling time will be short, and more drills can be run with a given size compressor than where the material is hard and the drills running continuously for a longer period, thereby increasing the chance of all the drills drawing on the compressor at the same time.

The capacities in this table are based on sixty

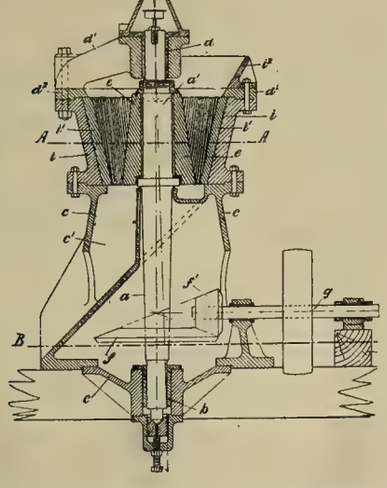
pounds air pressure; if seventy-five pounds are used, one-fifth more volume should be added; if ninety pounds, two-fifths should be added to the volume stated in the table:



Number of Machines.	2½-inch.	3⅛-inch.
1	65	115
2	110	200
3	156	294
4	196	372
5	230	445
6	264	516
7	294	581
8	320	640
9	360	720
10	400	800
12	480	960
15	...	1,200
20	...	1,600
25	...	2,000
30	...	2,400
40	...	3,200

Latest Mining and Metallurgical Patents.

Patents Issued March 27, 1900.

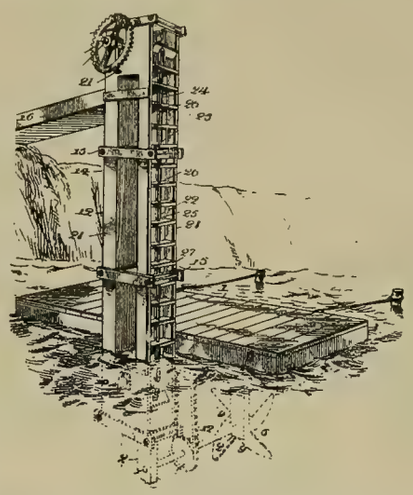


Specially Reported for the MINING AND SCIENTIFIC PRESS.

ORE CONCENTRATOR.—No. 645,987; W. E. Wild, Denver, Colo.

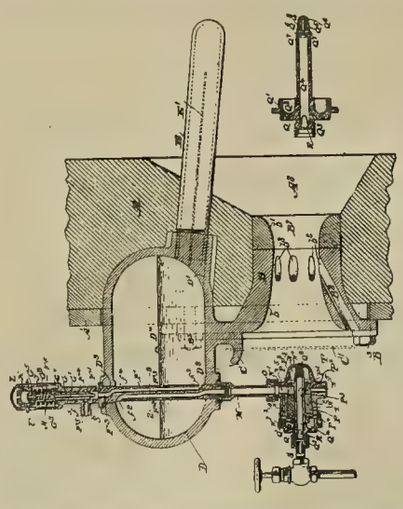
Combination with any suitable concentrator belt, suitable belt supporting pulleys, and supporting table or framework for belt and pulleys, of suitable foundation or bed plate of timbers adapted to form base of concentrator, journal boxes secured to opposite sides of bed plate, vertically disposed supporting frame pivotally journaled in boxes and arranged transversely across belt and table and at central portions of their length, having trunnions on its opposite ends, saddle plate secured transversely across bottom of belt supporting frame or table and box secured on one side of saddle and arranged to adjust itself independent of movements of table, to one of the trunnions of vertical frame and box on opposite side of saddle supported in vertical guideways formed in saddle and bearing on opposite trunnion of supporting frame, a screw threaded to saddle and arranged to bear on box, and means including a check nut for securing screw in an adjusted position.

ORE OR ROCK BREAKING MACHINE.—No. 646,204; E. Comerford, Liverpool, England.



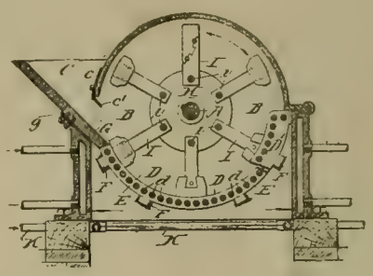
A rock, ore, or analogous breaking machine, the outer conical body having its axis vertical, an inner loosely mounted crushing barrel e, and a vertical operating shaft a, having its bearing axes at the upper and lower ends concentric with the axis of the body, and having an eccentric portion a′ on which the crushing barrel e is mounted and free to revolve, with its axis inclined outward from the upper end toward the lower end, whereby the eccentricity of the lower part of barrel bearing portion a′ is greater than the eccentricity of the upper part.

ROCK DRILL.—No. 646,343; R. Avery, Sausalito, Cal.



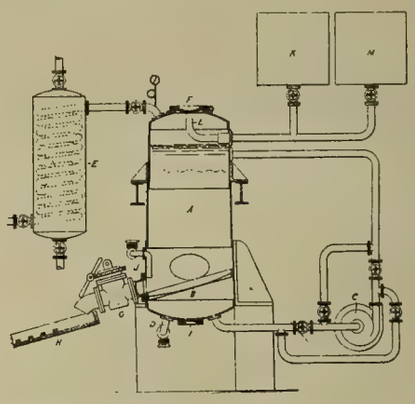
With fixed support, casing carried thereby, sleeve within casing through which drill shank passes, having a flange at one end with edge slots, a second sleeve in line therewith having arms engaging slots, and a reduced portion provided with ratchet teeth; a pawl engaging teeth, and means for actuating it, teeth formed on end of larger part of ratchet sleeve, a fixed ring having similar teeth so that the turning of the ratchet sleeve engages the teeth and moves ratchet and flanged sleeve back from fixed ring, grips carried by flanged sleeve to move drill in unison with sleeve, and a spring by which the parts are returned when the engaging teeth have passed each other.

CURRENT WHEEL.—No. 646,338; J. Winter and A. D. Gill, Landusky, Mont.



Combination of a float having depending hangers, a drive shaft mounted in the lower end of hangers, a current wheel keyed to projecting end of shaft, counter-shaft operated by driving shaft through suitable gearing, frame projecting below float, inclosed on three sides, to furnish one bearing for counter-shaft and to form a still-water space or well and a water elevator, as a chain pump, leading from still-water space or well, operatively connected with counter-shaft.

MECHANISM FOR THROWING SPRAYS OF OIL INTO FURNACES.—No. 646,352; T. R. Browne, Altoona, Pa.

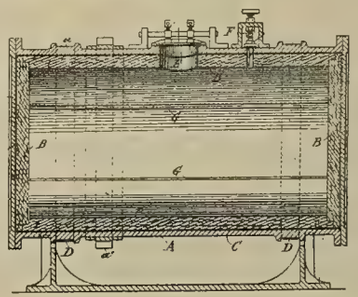


An oil spraying device comprising the receiving nozzle B and the steam box D attached rigidly together and having the steaming tubes E extended from the steam box in front of and above the nozzle, and an oil spraying fixture supported on the steam box in line with the nozzle, and in communication with the upper part of the steam box.

CRUSHER AND PULVERIZER.—No. 646,250; M. F. Williams, St. Louis Mo.

A crusher comprising a casing, rotary shaft, hammer support, secured on shaft, hammers pivoted to hammer support, consisting individually of a bar having a projection at outer end, a head having shoulder and slidingly mounted on bar, and one or more interposed pieces between shoulder and projection for adjustably limiting outward movement of head on bar under centrifugal action, and opposing devices co-operating with hammers.

PROCESS OF TREATING GOLD ORES.—No. 646,335; C. Wetherwax, Best, N. Y.



In treatment of gold ores for liberating gold from its combination or association with other element or compounds, a process which consists in digesting the ore under steam pressure in a solution containing water glass (sodium or potassium silicate) and caustic soda or caustic potash, caused to circulate through the ore.

PROSPECTING DISH.—No. 646,382; W. G. Collins, Coramba, New South Wales.

A prospecting dish or the like having an angle plate secured to its side wall and extending only portion of way around wall, the angle between inner faces of wall and projecting straight ledge of angle plate being not greater than 90°, whereby when dish is tilted during operation of washing a pocket is formed between plate and wall.

TREATMENT OF GOLD AND SILVER ORES, ETC.—No. 646,006; J. C. Montgomerie, Stair, Scotland, and Henry Parkes, London.

In the extraction of gold and silver from ores or compounds containing the same, process consisting in treating the ore or compound with a cyanide of an alkali metal, caustic alkali and barium dioxide in conjunction with ammonium sulphate.

The Thorpe Group of Antimony Claims, Austin, Nevada.*

Written for the MINING AND SCIENTIFIC PRESS by W. C. GAYHART.

Increased demand for antimony occasions interest in such mines as are producing or are capable of producing any considerable quantity of antimony ore, when economic conditions favor cheap and easy operation and transportation. The Thorpe group of mines, consisting of four claims, are seven miles south-southwest from Austin, Lander county, Nevada, where the owners, John Thorpe & Son, reside. These claims occupy the summit of a lofty spur that extends to the westward from the main ridge of the Toiyabe mountains, at an elevation of 9000 feet above the sea and 3000 feet above the adjacent Reese River valley which they overlook. The sides of this spur slope about 32° from the horizon into narrow canyons which extend with easy grade to the valley.

The claims extend from the spur southeasterly along its crest, including 6000 feet of the ledge, crossing the axis of the western ridge at nearly a right angle, along the summit of a low divide which connects the western with the eastern ridge of the Toiyabes and separates the headwaters of Big creek, a stream of some 500 inches flowing into Reese river on the west, from the headwaters of Birch creek, a stream of about the same size flowing into Big Smoky valley on the east. The vein may be traced toward Bunker hill, the culminating peak of the eastern range. It appears to mark the anticlinal of an early geological time.

Throughout the length of the group the ledge projects above the ground as an immense dyke, some 80 to 90 feet in breadth, and upward 20 to 30 feet. In only one or two places does it appear to be partially buried and then by the product of the disintegration of the mountain slates and shales. At the surface the dyke consists largely of quartz porphyry and breccia, a hard, dark-colored rock enclosing large pieces of irregularly shaped pieces of quartz; at the depth of a few feet this appears to give place to more uniform quartz in which is disseminated throughout stibnite ore carrying from 20% to 50% antimony.

Development has mostly been done near the center of the group, and consists of a crosscut through the ledge, showing ore the width of the ledge, at this point 80 feet. This crosscut is at the eastern end of the Mountain View lode, the most western of the group of claims. A few hundred feet east of the crosscut an incline shaft has been sunk 100 feet, near the western end of the adjoining Mammoth lode. In sinking this shaft thirty-five tons ore averaging 55% were taken out, and a larger quantity of ore averaging 20%. The facilities for sinking and hoisting are crude, and work was abandoned when the snow began. Little work has been done on the Commodore and Confidence lodes at the eastern end of the group, although the ledge there is equally promising. The ledge at the surface is in limestone and shale of the lower Carboniferous period, which at no great depth gives place to granite and diorite which here constitute the core of tne mountains. It is nearly vertical, dipping 10° from the vertical toward the south.

A good road extends from the foot of the mountain to Austin depot, and an abundance of wood grows on the mountains near the mine. The high grade ore is worth $45 per ton f. o. b. at Austin. Tests show that the low grade ore can be concentrated up to 75%, and such concentrates carry $5.16 in gold and two ounces in silver per ton. There is a small supply of water at the mine, but for extensive operations water would have to be pumped three-quarters of a mile and raised to an elevation of 1000 feet. The character of the surface is such that 1000 feet of tunnel would give approximately 600 feet of backs, intersecting the ore chute at its central point, from which, at the surface, it appears to extend some 200 or 300 feet in each direction. The owners are now fitting up improved hoisting machinery, preparatory to sinking 100 feet farther this spring.

* See illustration on front page.

Origin of the Telephone.

Prof. A. M. Bell, hale and hearty at eighty-two years of age, writes from his residence in Washington, D. C., as to the incitements which led his son to the invention of the telephone:

"In the boyhood of my three sons I took them to see the speaking machine of Herr Faber, and we were all greatly interested in it professionally. To test their theoretical knowledge, and their mechanical ingenuity, I offered a prize to the one who should produce the best results in imitation of speech by mechanical means. All, of course, set to work, but nothing of startling novelty was devised. The scheme of my second son, A. G. Bell, was, however, the best. This contest—as well as the whole course of the boys' education—directed their minds to the subject, until the sole survivor of the lads came to the conclusion that imitative mechanism might be dispensed with, and merely the vibrations of speech be transmitted to an electric wire. This was entirely his own idea. He illustrated it to me by diagrams, and sketched out the whole plan of central office communication, long before anything had been done for the practical realization of the idea. I can claim nothing in the telephone but the impulse which led to it."

Prospectors' Mistakes.

NUMBER II.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by "A PROSPECTOR."

Many prospectors, especially those in quest of free gold, overlook valuable claims by placing too much dependence upon the mortar and pan. While, as a general rule, ores in gold-bearing districts show some free gold, it does not follow that all the values lie in that portion that is obtained in the horn.

Ores containing silver values may at the same time contain enough gold that is not free, to justify terming them gold ores. Again there are a great many ores in which the gold, though practically free, is in such a fine state of division as to show not even a color by the horn test.

Some ores rich in gold would not be noticed by a regular prospector, for the reason that it has more the appearance of country rock than rock that would be supposed to carry gold.

Some of our richest mines have as gangue rock ordinary brown or iron-stained limestone. Some have as matrix nothing but common brown or iron-stained porphyry, which may be in the shape of small ledges a few feet in width or in large dykes or reefs 50 to 100 feet wide or even wider, still they carry gold values sufficient to make them good paying mines—in fact, almost any kind of rock may carry gold in profitable quantities.

Another class of mines that the prospector looking for gold would be very apt to pass by as beneath his notice are those of such magnitude that the very idea of their being worthy of investigation would be considered by him as preposterous. Large belts of schist containing numerous streaks and lenses of quartz, although apparently barren, may contain gold enough to make them veritable bonanzas. The gold may be free or the values may lie wholly, or nearly so, in small particles of sulphurets widely disseminated through the rock, both in the quartz and country rock or in either. The majority of the dividend-paying gold mines of to-day are just such propositions. They are to be sure mostly very low grade, but they are the kind of mines that capital is looking for.

There are also waiting to be discovered and opened base propositions that most prospectors consider as worthless simply because they are base.

If the prospector is of the free gold type he will not even know that they contain gold at all, but will let them lie and move on to some section where the ores are not base. If he happens instead to be a man who considers it worth while to have the ore assayed, he will know that the bases carry values high enough perhaps to make them profitable, providing they were free, but as the ore is base he passes on. Where the latter makes his mistake is in not considering the fact that in this age of machinery and improved appliances so-called base ores are made to pay a profit, whereas a few years ago were the same values in the shape of free gold they could not be handled at a profit.

It is well for a prospector, before starting out, to consider that a mine will pay:

First—Though small if rich enough, though of low grade if large enough. The exercise of a little judgment will enable him to determine the medium of the two extremes. He must leave a large margin in determining the relative limit in size and richness of his ore body. Better far to be prejudiced against the probability of his undertaking proving valuable, if he desires to be on the safe side.

Second—He should not rely upon a horn test, but consider that although a few assays will cost him a certain amount of money, it is nevertheless far cheaper to know definitely the value of his ore than to spend his time upon something it were better to let alone, or to leave something valuable and not know it to look for something better.

Third—Let him realize that if there is anything in his line of which he is ignorant and in doubt, in the matter of actual economic value of certain classes of ores, there are hundreds of men who can and will enlighten him if he will but inquire. There is hardly a question he could ask in relation to his business but that could be answered in the columns of the MINING AND SCIENTIFIC PRESS.

Fourth—In seeking to sell a prospect, or in trying to interest capital, he should by all means state the facts as he knows them and leave it to the investor to theorize and draw his own conclusions. No prospector ever yet aided his cause by misrepresenting anything in connection with his claim. No investor ever examined a claim which he found to have been willfully misrepresented, who did not go away disgusted.

Fifth, and perhaps not least, the prospector should not confine himself to hunting for quartz, but any kind of rock out of the ordinary, of which there appears to be less than a mountain, should be considered worthy of investigation, for the mine of the future will be one that has been overlooked, simply because it is different from the usual run of things.

Of Value to Miners Everywhere.

One of the latest instruments placed on the market by the Ericsson Telephone Co., No. 296 Broadway, New York City, is shown by the accompanying illustration, this being a combination instrument which can be used for either wall or desk. The magneto is without gravity hook and can be used for either long or short distance work.

The Ericsson Telephone.

When used on a desk the magneto is placed in the usual position under the desk, the same as when using an all-nickel desk set. In that case the combined transmitter and receiver (called hand microtelephone) can either be placed on the flat of the desk, in a pigeon hole, on the top of the desk or hung on the side of the desk, if desired, if more than one person is to use the instrument.

When used as a wall telephone, the hand microtelephone can be hung on an ordinary hook and placed at any convenient height, so that it can be taken down for use either by a child or grown person. The hand microtelephone is used by grasping the handle in the left hand, holding the receiver to the ear, which brings the transmitter at a proper distance from the mouth, the switch in the handle which is pressed by the fingers, making all the connections, and when released the instrument is cut out, the same as with a gravity hook such as is used in any ordinary telephone.

This instrument is growing in popularity on account of its utility and convenience, it being a most practical instrument for general purposes, and sold at a reasonable price.

The company also makes a variety of other styles for exchanges and will give particulars on application.

Horse Power Required for 20-Stamp Mill.

TO THE EDITOR:—Will you kindly give me the horse power required to run each of these 20-stamp mills?

First 20 stamps—1000-lb. stamps, 104 drops per minute; 12-ft. counter shaft pulley; 45-in. friction pulley; 6-ft. cam shaft pulley.

Second 20 stamps—1000-lb. stamps, 104 drops per minute; 14-ft. counter shaft pulley; 45-in. friction pulley; 6-ft. cam shaft pulley.

To give correct information in such cases requires complete data furnished by the inquirer. In the above case nothing is said about the other machinery of the mill nor is the height of the drop given.

The two mills would require practically the same power, the difference in the driven pulley being not of material import.

Assuming the height of drop to be 6 inches in both cases, therefore at 104 drops each 1000-lb. stamp would be raised 52 feet high per minute. Then: $\left(\frac{52 \times 1000 \times 20}{33{,}000} + 20\% \text{ for shafting and friction}\right) =$ 37.87, say 38 H. P. to drive each 20 stamps.

It is not to be understood, however, that that horse power would be sufficient to run all that is ordinarily meant by "a 20-stamp mill."

Efficiency of Air Compressors at Different Altitudes.

Following is a table of efficiencies of compressors when the air is so used at sixty pounds per square inch gauge pressure and at various heights above sea level:

Height in Feet above Sea Level.	Barometer. Inches.	Efficiency of Compressor, Per Cent.
0	30	100.0
500	29.42	98.4
1,000	28.85	96.9
1,500	28.34	95.5
2,000	27.78	94.0
3,000	26.74	91.1
4,000	25.70	88.1
5,000	24.73	85.9
6,000	23.83	82.8
7,000	22.93	80.2
8,000	22.04	77.5
9,000	21.22	75.1
10,000	20.43	72.7
12,000	18.92	68.0

MINING SUMMARY.

ALASKA.

C. Gustafson heads a company from Oakland, Cal., to dredge at Cape Nome.

The Alaska Copper Co., at Copper mountain, has seventeen claims 230 miles from Wrangel. Supt. Mellen expects to ship ore this summer.

Four miles from the Alaska Copper Co.'s property a New York company has several claims and is locally credited with intention to put 300 men at development work this summer.

ARIZONA.

S. A. Rank has been appointed Mgr. Union & Bonanza Tunnel Co., Chase gulch.

GILA COUNTY.

Times: At the Yo Tambien mine, Pinto district, G. Calder, Supt. Pinto M. & M. Co., has a 4½-foot ledge of 18% copper ore, carrying $11 in gold and nine ounces in silver. The company expects to erect a smelter shortly.

GRAHAM COUNTY.

At Safford the Copper Bell group of mines is bonded to R. G. Ruff for $75,000, he representing the Mount Turnbull M. Co.

MARICOPA COUNTY.

The Henrietta G. M. Co. has incorporated at Dover, Delaware, capital $1,000,000, to operate near Phœnix.

PIMA COUNTY.

The Austerlitz M. Co. has incorporated to develop the Austerlitz group of mines, Oro Blanco district.

YAVAPAI COUNTY.

The smelter of the Arizona Eastern & Montana Co. at Big Bug has started up again. C. W. Stickney is Supt.

The United Verde mine, Jerome, consists of about a dozen mining claims of uniform size, but of irregular platting. A local paper says that a sharp Prescott surveyor found, right in the heart of the mineralized portion of the property, that a small triangular piece (little more than 100 feet on a side) had been overlooked in patenting the surrounding claims. He promptly located the ground and commenced preparations for sinking a shaft; but the company, making the best of the situation, bought off the locator at once, paying him $6000 for his rights.

Jerome reports a gold discovery eight miles from there, on the United Verde Railroad, and miners are flocking there to the Clure-Weeden group, where the vein exposed is going down. Ore is being sacked at the Clure-Weeden claims for shipment, and five tons for a test will be shipped.

CALIFORNIA.

BUTTE COUNTY.

The Bader mine, near Magalia, has closed down temporarily. The mine is to be worked by ground sluicing.

CALAVERAS COUNTY.

W. W. Cook's new 10-stamp mill, Birdena quartz mine, Campo Seco district, is completed.

A San Francisco company has leased the Hannon, near Valley Spring, and will dredge the Calaveras river.

Prospect: The San Justo mine is expected to start up soon with Supt. Holmes. ——The board of directors of the Lightner mine will issue 10,000 more shares of stock, to be offered to the present shareholders pro rata at $1 per share.——The Union Copper M. Co. at Copperopolis is making extensive purchases of adjoining properties and negotiating for still other ground.

KERN COUNTY.

At the B. & S. D. M. Co.'s property the hydraulic syphon has unwatered the old workings successfully. A gasoline engine will now be used.

In the Kern river district eight wells are being pumped at the same time at the works of the West Shore Co. Walking beams with counter weights at each pump are operated by a line of wire rope running on pulley rollers on poles 50 feet apart. Part of the ropes terminate upon the periphery of a horizontal wheel borne upon a vertical shaft; part of them hook into an eccentric oval horizontally placed just below the wheel. The vertical shaft is revolved by cog gear. A wire rope runs from the eccentric wheel backward to a great counterbalance on one corner of a triangular walking beam. As the shaft revolves the cords all operate the weighted walking beams simultaneously, the counterbalance restores the lines taut, and eight wells are pumped under the supervision of three men—one to attend to the power and the others to watch the pumps and keep things in order.

LAKE COUNTY.

A. Rocca has sold his interest in the Great Western quicksilver mine, near Middletown, and will take up the American.

LOS ANGELES COUNTY.

The Oceanic Oil Co.'s well in Los Angeles has reached the deep oil sand at a depth of 1030 feet; there is a flow of oil. The drill is 20 feet in the sand.

The Soquel Canyon Oil Co. has begun operations near Fullerton.

Indications are reported promising in the well at Fullerton being drilled by the Fullerton Con. Oil Co. Oil has been struck on adjoining property of 32° gravity.

MARIPOSA COUNTY.

At the Mariposa Commercial & M. Co.'s Josephine and Pine Tree mines, Bear Valley, in the Josephine mine the management intends drifting 1000 feet on the vein, of which 400 feet has now been accomplished. Sixteen men are at work. The vein of the Pine Tree parallels the Josephine, and is being worked through a tunnel. There are twenty-five men at work.

At the Gold Bug mine, Kinsley, ore is being shipped to the Selby smelter in San Francisco.

The Merced G. M. Co. is pushing development work on the Mary Harrison. The 800-foot level has been reached.

The Columbus M. Co., four miles west of Coulterville, will construct a five-mile flume from Maxwell creek to the millsite. A fall of 1500 feet will be secured from where the flume reaches the top of the mountain to the mill below.

The Gazette reports in the Mary Harrison mine a shoot of ore south of the main shaft showing free gold. Sixty men are now employed by the company.

NEVADA COUNTY.

(Special Correspondence).—The enterprise of the Champion Con. M. Co., on Deer creek, is the most extensive in Nevada City district. About twenty-five claims have been consolidated, including such important properties as the Spanish, Wyoming and Merrifield. Recently the Nevada City has been added to the company's purchases. Some excellent ore is now being taken from the Merrifield shaft. As soon as systematic work can be done in the Nevada City, it is expected that property will yield good returns. Legal entanglements, now settled by the Champion purchase, have alone stood in the way of a profitable working of the mine for many years. The 5½x15-foot main incline at the Champion (see illustration on first page) is down to a depth of 2400 feet; at the Merrifield the 5x8-foot incline is down to a depth of 700 feet. Here a Cornish pump has lately been installed. It is run by a 10-foot Pelton water wheel, direct connected to the shaft carrying the pinion for the pump. Power at the Champion mill and hoists is derived from water under a vertical fall of 400 feet. The mill contains forty stamps and sixteen 4-foot concentrators. There is a chlorination plant of four-ton capacity, and an extensive sulphuret-saving plant is contemplated. Mill, hoists and grounds are lighted by electricity from the company's dynamo, which furnishes eighty-five incandescent lights of sixteen candle power. At the Spanish the incline shaft is down 800 feet. Here the hoist and pump, as well as a 10-stamp mill, are run by water. There are a 10-stamp mill and hoisting works at the Nevada City, but it is not probable they will be used, as the Nevada City ground can easily be reached by drifts from the Champion. About 160 men are now on the payroll of the Champion Co. Fred Zeitler is Supt., Henry B. Fuller foreman at the Spanish; Jno. Frederick foreman at the Champion, C. H. Weber millman.

The Providence mine, near Nevada City, on the opposite side of Deer creek from the Champion, is still a bullion producer after twenty-five years of checkered history and the production of more than $5,000,000 in wealth. The incline shaft is 2000 feet deep. The plant—a perfect one of its kind when installed several years ago—has not needed reconstruction, but runs smoothly at the present time. The reversible geared hoist of great strength and the Cornish pump are run by water. There is a fall of 350 feet here; 400 feet at the mill. The system of pumps, all attached to the same rod, consists of one 10-inch, four 8-inch and one 6-inch, stationed at various levels in the mine. There are steam attachments in reserve for pump and hoist. An air compressor, with cylinders 14x18 inches, is run by a 13-foot Tuthill water wheel, direct connected. In the mill the ore finds its way by gravity from the bins to the concentrators. There are forty stamps, with sixteen 4-foot vanners. A large drying room for the concentrates, elaborately glazed, has been built on the south side of the mill. Below the mill is an extensive sulphuret saver, run by a 2 H. P. electric motor, and owned by J. O. Wells, who pays a royalty to the Providence Co. The Providence chlorination works were destroyed by fire a few years ago and have never been rebuilt. Ordinarily the Providence Co. carries the names of 90 to 100 men on its payroll. Wm. McKinlay is Supt.; two of his sons act as assayer and machinist.

The Mountaineer mine, adjoining the Champion on the east, has taken on a new lease of life since November last. When the late superintendent was placed in charge, he made it a primary condition of his engagement that the company should place at his disposal several thousand dollars to be used in improving the mine and the equipment. He retimbered and repaired within the mine, entirely reconstructed the 20-stamp mill and added an extensive blanket plant. The value of the ore lies two-thirds in the sulphurets, one-third in free gold. The ground in the mine is very hard. An air compressor and five machine drills have been added. This will enable them to keep the twenty stamps supplied. The ledge in the Mountaineer is parallel to the Champion, and averages 18 inches in thickness. The mine is opened by a drain tunnel which runs 832 feet into the side hill. Here a station has been cut out, and the hoist is placed. The shaft goes down 1200 feet from this point, at an inclination of 38°. There are ten levels on the north side of the shaft and eight on the south, the drifts extending in one or two instances 800 to 1000 feet. The ore in each car is weighed and sampled as it is taken into the mill, and a record of the same is kept, thus enabling the management to know which part of the mine is yielding best returns. Water under a vertical fall of 320 feet is the main power employed, and will continue to be used at hoist and Cornish pump; but a 160 H. P. electric motor now supplies power to run the air compressor, and the same power will be drawn upon for the mill. Besides a rock breaker, which has also been added of late, there are twenty stamps in the mill and eight concentrators. A hydraulic pump elevates the tailings before the same are projected upon the slime tables. About seventy men are employed.

The Phœnix mine, southeast of Nevada City, which started operations about three years ago as successor to the old Sneath & Clay, is working along in a modest style. The old shaft, 500 feet deep, has been increased in depth only 100 feet since being cleaned out and partially retimbered. A north drift is being driven on the lowest level at the present time. The ledge is not a large one, but is rich in spots, and the ten stamps in the mill can crush during the day all the ore which both day and night shifts of four men each take from the mine. The ore is heavily mineralized and should be smelted to get best results. The single-reel friction hoist, the Cornish pump and the mill are all run by water, which is brought to the mine through 4500 feet of pipe, giving a vertical fall of 500 feet. The expense for power does not exceed $2 per day. A small water wheel runs an electric dynamo for lights. Cincinnati people are stockholders in this mine. David Hutchison is Supt.

The Mayflower mine is east of Nevada City, on Canada hill. Besides several different ledges, the company owns a gravel claim, which was worked as a hydraulic proposition until enjoined by the courts. This part of the property may yet be opened as a drift mine. There is now a tunnel of 2200 feet leading toward the channel. The ledge of ore which is now being worked through the 700-foot incline shaft is from 8 to 10 inches in thickness. Enough ore is obtained to keep one-half of the 20-stamp mill in operation; the ore is from 2% to 2½% sulphurets. The lighter sulphurets are saved on a blanket plant. Hoist, pump and mill are run by water taken from the South Yuba ditch and brought to the mine under 320 feet vertical fall. The hoist is a strong, double-reel, geared machine. The mill contains four concentrators. The owners, Messrs. Martin Bros., Jno. Waters and Jno. H. Richards, all of Nevada City, are constantly developing their property.

The Home mine, adjoining the Providence, on Deer creek, has its incline shaft down 400 feet. They have a good property on a paying basis. Enough ore is being taken out to keep the adjoining 10-stamp mill busy (leased of the Cadmus). Three power drills are kept continually at work in drifts and stopes. Water under 200 feet pressure is utilized for power at the hoist and pump. L. J. Rose, Jr., representing the estate of the late L. J. Rose, controlling stockholder, has recently visited the property, and, after consultation with Supt. D. J. McFall, it has been decided to construct at an early date a 20-stamp mill and a compressor plant. This will make the Home one of the leading mines of the district.

The Cadmus mine adjoins the Home on the south. The shaft is down 500 feet. Water is the power used, under a fall of 200 feet at the hoist and 260 feet at the mill, which is modern in equipment and well planned. There are ten stamps and two concentrators. A 5-foot wheel runs the hoist, another 5-foot wheel is used for the pump and a 9-foot wheel for the compressor. San Francisco and Stockton business men are the principal stockholders. Chas. Kahl is Supt.

It is probable that the entire plant at the Reward mine, one mile from Nevada City, will soon be remodeled. Up to the present time steam has been the motive power. It is proposed to substitute electricity or water, and a decision will be reached at the directors' meeting on the 5th of April. The heavy friction hoist and the Cornish pump will be put on cement foundations, the same to replace the partially decayed timbers now serving that purpose. The 2-stamp, triple-discharge battery will be added to by two more of the same kind and the property changed from a developing prospect to a working mine. The shaft is now down 1000 feet, and there is a good 6-inch ledge. A 6-inch pump at the 1000 level and an 8-inch at the 700 level raise the water in the mine to a drain tunnel at the 400 level leading to Deer creek. R. C. Walrath, one of the owners, is Gen. Mgr.; J. T. Gribble Supt.

The California Con., embracing the California and the Gold Tunnel claims, adjoins the Reward on the north, and is owned by A. D. Allan, the Nevada City foundryman. Twenty tons of ore recently taken out by tributers, and crushed at the Nevada City custom mill, yielded excellent returns. The development is limited to several drifts running out from a 400-foot incline shaft, which extends to a drain tunnel. A small steam hoist is the only machine equipment. Harry and Van Carrow and Stephen Roberts are working the south portion of the mine on a lease.

That famous old property, the Pittsburg, south of Nevada City, is kept open by its principal owner, Sam'l Granger of Grass Valley, and, with tributers, a force of forty men is now employed here. Fifteen are engaged at day's pay. Work is going on at various levels from 200 down to 800 feet. From that depth to the bottom of the shaft (1000 feet) the mine has not yet been unwatered since filling up during the winter. The hoist, pump and 10-stamp mill are run by water. A. A. Charonnat runs the hoist and superintends operations.

The Texas mine in Willow valley, northeast of Nevada City, is exceptionally complete in equipment. It has separate water wheels for its hoist, pump and air compressor, and has in reserve a steam plant with which to run any of these machines, should accident occur to the water supply. Besides the Cornish pump, there is a steam pump at the 200 level in the mine to assist the larger machine when the water becomes troublesome. The hoist is a single-reel, friction machine. The shaft is vertical and is 250 feet deep. Ore is being taken from the 160 and 250 levels, the vein being from 2 to 6 feet thick; it is 2% sulphurets. There are four parallel veins in the property. The 10-stamp mill, run by water under a vertical fall of 250 feet, is so constructed that ten additional stamps can be added without enlarging the building. Below the stamps are two 6-foot concentrators, and in an adjoining room a three-ton cyanide plant has been in operation for some time with good results. J. Korbel, president of the company, is now examining the operations of the mine; Wm. Fisher is millman; Percy Watters engineer. About fifteen men are employed.

The Buckeye is one of the promising leads in Willow valley. It is in slate, parallel to and adjoining the contact with granite. The formation resembles that at the Champion and Providence. About thirty years ago 300 tons of ore were taken out and worked, yielding from $7 to $100 per ton. In places rich specimen ore was found. The present owners, being unable to put up machinery, are driving a tunnel to tap the main lead at a depth of 100 feet. This tunnel is now following a small vein of good ore, and has about 200 feet to run before reaching the main ledge. T. B. Gray is principal owner.

Willow valley seems to be a coming district, and greater activity is being displayed here than elsewhere. Within the past week the Franklin mine, formerly owned by M. Hussey, has been bonded to E. D. Boyle, who has resigned the superintendency of the Alta mine, Gold Hill, Nevada, to take up work on his new enterprise. He has contracted for 2000 feet water pipe to bring water from the South Yuba ditch. A fall of 275 feet, vertical, will be obtained. A prospecting hoist will be procured at once, the present shaft will be sunk deeper and the four ledges existing in the property will be thoroughly developed.

The La Belle and the McKinley, two locations in Willow valley, are to be developed under the superintendency of J. L. Postlethwaite. Considerable work has been done on these claims in the way

of tunnels, drifts and raises. Mr. Postlethwaite will continue an east drift to the contact, where it is expected an ore body will be opened. The parties now in control stand ready to erect a 10-stamp mill and an air compressor plant, the latter to be utilized in running power drills in the mine.

The Lecompton mine, Willow valley, owned by J. J. Ott, has been producing some excellent ore of late by lessees and tributers, who pay 10%. The ledge is heavily mineralized. Portions which were assorted and sent to Selby's, to be smelted, returned $354 per ton; considerable ore has been put through Locklin's mill, which yielded $82 per ton in free gold, exclusive of sulphurets. The Lecompton has not been extensively developed.

The Montana mine, Willow valley, three miles from Nevada City, has recently been sold to the Anglo-Swiss Bank of San Francisco. A pipe line one and one-half miles long will be laid, so that the new machinery for hoist, pump and compressor may be run by water. The old two-compartment shaft, 300 feet deep, will be carried down 500 feet farther and the mine otherwise developed.

The old Banner mine, owned by Mrs. Huntington, formerly proprietor of the Nevada City Water Works, has been bonded by San Francisco and Stockton men, with F. M. Manson, formerly of Sierra county, as Supt. This property paid well in former years. There is a good, strong 8-foot ledge, well mineralized but somewhat rebellious. The new company has begun operations preparatory to the putting in of a hoist, pump, etc. It is probable that Wm. Floyd of Nevada City, former foreman of the mine, will be called to his old position. The bond runs for two years.

The Charonnat is another old mine near Nevada City, which will be opened during the coming summer. A company of Eastern capitalists has made arrangements with Geo. C. Gaylord to take hold of the property. They will repair the hoist and put in a pump and other machinery. The old shaft is 1300 feet deep. Fully $600,000 was taken out of the mine, under old methods, before it was shut down.

The Pioneer Reduction Co. have their works on the Grass Valley road, less than a mile west of Nevada City. Through the adoption of approved modern features, and by intelligent management, they have increased business. Besides the old-time chlorination plant, they have a matte furnace, smelter and a pulverizer. The furnace is heated by crude petroleum. In the same building, and auxiliary to the matte furnace, is an automatic roaster, in which the sulphurets are automatically fed into the furnace and kept agitated, as well as moved slowly forward, by a series of shovels arranged upon an endless chain. The capacity of this furnace and the smelter is fifteen tons per day; of the chlorination plant five tons per day. The tailings of the old chlorination plant, which contain copper and other metals not previously extracted, are run through the matte furnace with fresh sulphurets and selected ores. Benj. Hall is Pres. and Gen. Mgr.; J. H. English, Sec.; Wm. Black, Vice-Pres.; D. E. Morgan, Treas.

Locklin's custom mill for reduction of ores, on Deer creek, in the edge of Willow valley, is kept constantly at work, mostly on the product obtained by tributers in the contiguous territory.

The Martin-Muir Co., Nevada City, have finished a second 10-stamp battery for the Mountaineer mine. Martin Bros. and David Muir are proprietors.

Nevada City, March 25. H. G. P.

PLACER COUNTY.

Sentinel: The Bellevue Con. M. Co. have put in a new 36-foot wheel to run their new hoist at their mine near Ophir. Spurgeon Bartlett is Supt.——Supt. Eastwood of the Hathaway mine, near Ophir, is placing the new 20-stamp mill and machinery.

PLUMAS COUNTY.

W. E. Duncan Sr., C. E. Ertz and Hallsted Bros. have given a working bond on the Duncan and Hallsted quartz mines, Rich Gulch, to men who will develop the properties.

SAN BERNARDINO COUNTY.

J. B. Lane is now Supt. of the Barstow mill, which is running on ore from Randsburg. H. Meade is superintending the cyanide plant at Barstow.

SAN DIEGO COUNTY.

Dr. Stanley has bought the tailings at the Shenandoah mine at Mesa Grande, and will move his cyanide plant there from Banner.

SHASTA COUNTY.

Supt. Shepard has a 6-foot ledge of sulphuret ore in a drift from the new 200-foot shaft of the old Spanish mine.

The National Con. M. Co. has levied an assessment of 5 cents per share, delinquent May 1st.

SISKIYOU COUNTY.

(Special Correspondence).—H. Mattern and associates of Ashland have bought J. L. Coyl's Tannina mine, an extension of Jillson's mine, thus making about fifteen claims this company has acquired in this section.

The 10-stamp mill on the old Sterling mine was started last week. They have struck rich rock and are going to put in twenty stamps this summer. The Sterling Co. bought the Pitchin, an extension, from C. R. Wiegel.

J. Downing, on Ash creek, has some more rich specimen rock on the Little Beryl, where a $10,000 pocket was taken out four years ago.

The Jillson mine, near Henley, continues paying handsomely. Ten stamps more will be added this summer.

Hornbrook, April 5.

Journal: A Chicago company will build a steam dredger on McAdams creek.——The Jillson & Roberts quartz mine, near Hornbrook, is paying. Sixty men keep the mill running constantly.——The Portland company is building a ditch five miles long to the Poverty Point mine at Oak Bar.

TUOLUMNE COUNTY.

Big Oak M. Co. has incorporated at Fresno, with $100,000 authorized and $500 subscribed capital, to succeed the Tuolumne Mother Lode Co.

Independent: E. C. Holmes, Supt. Mohican M. Co., has a bond on the Florida, near Carters.——The mill at the Providence is hung up and a portion of the underground force laid off, pending the result of water rights litigation.——W. W. Robinson has secured a bond on the Wheal-Perrin and will have the mine worked.——The strike made in the Grizzly continues richer than ever. It was made at the 700, where the vein shows 10 feet of solid quartz between walls.

TRINITY COUNTY.

Supt. Dobler of the Brown Bear, Deadwood, has a tunnel in over 3100 feet; the ledge was cut at a distance of nearly 3000 feet. The new mill will soon be begun.

COLORADO.

BOULDER COUNTY.

At Boulder the Atlas Reduction Co., formerly the Delano chlorination mill, is superintended by C. D. Grove and is in operation.

CLEAR CREEK COUNTY.

A. T. Chapman, S. D. C. Hays and E. S. Ball constitute the Mount Wright M. & D. Co., capital stock $50,000, to operate in this county.

Georgetown reports a strike in the Scepter mine of the Astor group, going 417.71 ounces gold, 31% lead and sixty-nine ounces silver per ton.

Supt. Arnold of the Doric has resumed work. The machinery has been overhauled, a fan put in and 2400 feet of track relaid.

Near Idaho Springs, for the Seaton Co., Mgr. May is driving the Foxhall tunnel, drifting on the Seaton vein and working on the vein in the Newhouse tunnel, 2000 feet below the surface workings.

The Crown Point mine is moving ore to the Wilkie mill and treating the product under rapid-drop stamps. The mine has wide bodies of iron sulphide ore in all parts of the lower levels, which, when concentrated, is in demand at the smelters.

Georgetown Courier: One of the best finds ever met with in the Centennial mine was made this week in the third level east. The level had been passing through a fault for some distance, when suddenly an 18-inch vein of solid ore was opened up. A test run was made, showing it to carry 16 ounces silver and 3.3 ounces gold to the ton and about 5% copper.

DOLORES COUNTY.

The Colorado C. & M. Co. is shipping concentrates to Durango. Shipments of iron ore to the Durango smelter are on the increase.

FREMONT COUNTY.

In the Montana tunnel, east of Dawson, assays show, in a body of hematite 18 inches thick, $36 in gold.

At Florence the old Beam mill is being renovated and will resume operations.

GILPIN COUNTY.

In the tunnel, Geiger mine, Pine creek, an ore streak has been cut showing values of $128 a ton in gold.

The California mine is hoisting water from below the 1700-foot level.

Three miles of placer ground on North Clear creek, below Black Hawk, have been bought by the Gold Coin Placer Co., who intend working the whole of the creek bed. A flume will be built, track placer machines used, and derricks with steel buckets will scrape up the dirt and dump it in the flume. Work will commence at the lower end of the property and bedrock will be followed the whole distance.

GUNNISON COUNTY.

The Midland mine at Vulcan has a body of ore running four to five ounces gold, and when the drift is started at the 225-foot level it will have 1000 tons ready for stoping.

The Black Copper mine, south of Vulcan, will be operated this season. The vein has been opened for 4500 feet, showing copper values the entire way.

LAKE COUNTY.

The Ruby mine, California gulch slope of Iron hill, is yielding lead-iron sulphides, 1000 tons of ore per month. The Miner says returns from the settling assays show 18% lead, 28% iron excess with 13% zinc, and the bimetallic values show 10 ounces silver and 0.1 ounce gold.

The Home M. Co. at Leadville is now raising a larger amount of ore than at any previous time since the big strike, averaging for March about 450 tons. The Herald-Democrat says that during February the net smelter returns did not reach over $5, but lately there has been a decided improvement, and now the net values are nearly twice that sum.

The Montgomery shaft of the La Plata, worked under lease, recently entered a fine body of carbonate ore, which averages over 20% lead and runs quite high in silver.

Miner: The Excelsior Gold Mines Co., owning fifteen claims near Frisco, including the Excelsior mine, have started up their mill and are treating about fifty tons of raw ore per day. The ore is a copper-iron sulphide carrying values of $4 to $80 per ton in gold, 4% to 10% copper and a small amount of silver. The mine and mill are under the management of A. B. Ogden. The company has spent $150,000 in development and construction of mill and electric plant. The latter is on North Ten-mile creek, one mile above the tunnel and mill, and generates from the water of that creek 150 H. P. Work has been in progress at the mine for some time, a four-drill compressor being used, and a large amount of ore is now awaiting concentration by the mill. Much of the ore is of a smelting grade, but at the present time all of it is run through the mill. On the mine and mill twenty-five men are employed.

Chronicle: Leadville has found a new outlet for its iron ore. The smelters of Colorado are filled to overflowing, and for some time past the American S. & R. Co. has been directing a portion of the product to Utah. At present about 125 tons per day of Midas iron are going to the Germania plant of the American Co. at Salt Lake City. Over ten years ago a considerable quantity of oxidized Leadville iron was shipped to Utah, but in 1888 the movement of ore westward ceased, and it has not been resumed until recently.

MINERAL COUNTY.

The Amethyst is now shipping from the ninth level, which had been under water. There the gold values commenced.

Pres. Harvey of the Home M. Co., Leadville, has bought an interest in the Sulphide group and will develop it.

OURAY COUNTY.

Ironton, at the foot of Red mountain, reports two strikes. At the Mono an upraise cut a 12-foot vein of copper and silver ore, running $60 per ton; at the Guadaloupe, copper-silver ore, worth $75 per ton, the vein is 10 feet wide.

SAGUACHE COUNTY.

(Special Correspondence).—Philadelphia parties who purchased the Spanish grant, near here, are to erect a 100-stamp mill on the Independence mine.

Creston, March 31.

(Special Correspondence).—Philadelphia and Providence people are erecting a fifty-ton concentrator on the San Isabel mine at this place, in the Sangre de Christo range, twelve miles east of Moffat station in the San Luis valley. The plant will include an air compressor and a surface tramway 4000 feet long. The machinery for the concentrator is being furnished by the Mine & Smelter Supply Co. of Denver, and will include crushers, rolls and Wilfley tables. E. G. Granville is manager of the property.

San Isabel, March 31.

SAN JUAN COUNTY.

The Gold Bug and Repeal mines, Bear creek, have begun breaking down carload lots of the sylvanite and petzite ores, opened last summer.

SUMMIT COUNTY.

Kokomo now finds it impossible to secure enough cars to carry the ore which is being produced.

At Blue River valley the Oro Grande M. Co. has ten miles of placer ground, from Breckenridge to Dillon, and is using the Evans hydraulic elevator system for removing gravel and raising the pay dirt. The water is brought down from the penstock in a 30-inch pipe, split into several nozzles at the lower end. These play against the gravel bank, and by two other 2-inch nozzles playing into a 20-inch pipe running from the bottom of the pit up into a large 4-foot flume, the sand, gravel and smaller rocks are carried up into the flume, where the lighter gold is caught in the riffles, as in ordinary ground sluicing. The water in this flume is the same as that used for breaking down the gravel, an 8-inch pipe extending up alongside the larger pipe, taking the water out of the pit as rapidly as it enters by a similar method to that used in elevating the dirt. The larger rocks are raised by an electric elevator, the electric power being generated by the fall from the penstock to the bottom of the gulch. The lower portion of the gravel and the bedrock seams will be worked out by hand and run through a bedrock flume in the bottom of the pits.

TELLER COUNTY.

At Cripple Creek the Sitting Bull group has been bought by the Gould Co. for $75,000.

The Gillett reduction mill has begun shipping gold.

The Independence T. & M. Co. is daily putting out twenty-five tons of $70 ore.

Cripple Creek hears that C. C. Chapin will be able to push the Ophelia tunnel enterprise, by eight-hour shifts and modern drills through Gold and other hills, to its objective at Victor, a total distance of about three miles from its mouth near the city of Cripple Creek. It has now reached a distance of 4000 feet. There is a fine equipment of machinery.

The Strong mine closes for sixty days April 10, to install new machinery.

The Ajax, on Battle mountain, quits for thirty days while new engines and boilers are put in.

There is a local rumor that the Portland closes on April 10 for sixty days during the overhauling of its boilers.

It is understood that the real reason for cessation of work in these mines is the growing difficulty in mutually satisfactory arrangement of terms with the smelter trust.

The Cripple Creek Star, commenting upon the matter of the mill and smelter charges, says a ton of $30 ore now costs $9 for treatment, $1 for sampling, $3 for freight, and the mills pay only $19 an ounce for gold. This makes the charges $14 on $30 ore.

Post: The Creston Leasing Co., that for the last two and a half years has been digging in the Jack Pot ground, is about ready to quit operations for good. The lease has produced ore worth nearly $1,000,000, and the profit to the company, after royalties and other expenses have been paid, is a trifle over $400,000. Before the end of the week the Creston people will haul away their machinery and make their last shipment. They have taken a lease on the Hiawatha claim for the Monarch Co., where the machinery will be planted, and where they hope to meet with better success than has attended their late working of the Jack Pot.

Post: The Mary McKinney has reserves blocked out for extraction, but is shipping only twenty-five to thirty tons a day, yielding an average of $70 per ton. At the 400-foot level the ore shoot has been proved up for 1600 feet; the vein averages about 4 feet in width.——The Isabella is said to have cut the high-grade chute in the eleventh level, and that good ore is being followed on the old Buena Vista vein in the twelfth.——The Moon-Anchor will send out 100 tons carrying from two to three ounces. The output is about 560 tons per month.

IDAHO.

KOOTENAI COUNTY.

The Blue Bird mine on Lake Pend d'Oreille, near Lake View, reports $1506 net on a carload of ore. There were four lots upon which the smelter returns were respectively 196 ounces, 70 ounces, 164 ounces and 42 ounces of silver.

WASHINGTON COUNTY.

The Thunder Mountain Consolidated Gold Mines, Limited, capital stock 30,000,000 shares, has organized at Weiser to work the Thunder Mountain properties.

MICHIGAN.

J. Reed, for the Trimountain Co., will sink a permanent incline shaft at No. 2 shaft, where there is a vertical depth of 106 feet sand above ledge, thought to be the deepest shaft ever sunk without resorting to ammonia freezing process.

The Calumet & Hecla propose to establish a large foundry at Calumet for their own use. The mine now employs about 200 skilled mechanics at its machine and blacksmith shops.

MONTANA.

BEAVERHEAD COUNTY.

With the exception of the Bon Accord, all of the dredgers in the county are being put in readiness for the season's work.

SILVER BOW COUNTY.

The annual report of the Alice M. Co., at Walkerville, shows that the total re-

ceipts of the company for the previous year were $495,285.01, of which $354,371.12 was derived from the sale of bullion, $138,555.73 from the sale of ore, and the remainder from miscellaneous sources. The disbursements totaled $512,561.15—$17,276.14 in excess of the receipts. Of this amount, $86,079.13 was expended for labor and $106,840.08 for ore reduction. The superintendent's report shows that in the company's property are bodies of sulphide ore, for the successful treatment of which the management has been endeavoring to find a process.

The Montana Ore Purchasing Co. has begun suit against the Boston & Montana Co. to recover a judgment for $2,172,500, for alleged interference with the working of the Johnstown mining claim for eleven months.

NEVADA.

ESMERALDA COUNTY.

Eighty miles northeast of Candelaria, J. Farren says, ore has been found that shows 4000 ounces silver, 40% lead and $38 gold per ton.

WHITE PINE COUNTY.

At the Homestake mine at Hamilton sixteen men are at work. Five teams are hauling ore to Eureka for shipment over the E. & P. railroad.

NEW MEXICO.

GRANT COUNTY.

At Silver City the Graham Co. is working a force of fifty-six men in the Confidence mine. At Mogollon the Last Chance has twelve men at work in the mine and sixteen in the mill; Deep Down mine, twelve men; Little Fannie mine, thirty-two men; and the Cooney mine, twenty-three men in the mine and nine at the concentrators. The latter is shipping five and one-half tons of concentrates daily.

The reported sale of the Silver City Smelting Works to the El Paso smelting trust will not close that plant. Operations were suspended for two weeks to install new boilers.

OREGON.

BAKER COUNTY.

At the Alamo G. M. Co., Supt. Mahoney says the average assays taken at the bottom of the winze gave $17.23.

A strike is reported in the Weatherby-Bonanza mine, twenty miles southeast of Baker City, a ledge nearly 3 feet wide carrying free gold.

LANE COUNTY.

The Black Butte quicksilver mine has bought the Eugene street railway rolling stock for tramway use.

UTAH.

Dividends from the Utah mines for the first three months of 1900 aggregated $667,300; there were paid in March, $240,000.

TOOELE COUNTY.

The Peyton option on the lands of the Sunshine M. Co., at Sunshine, has been abandoned.

WYOMING.

CARBON COUNTY.

(Special Correspondence).—The property of the Kurtz-Chatterton Copper M. Co. is being developed by a tunnel 1380 feet long, which crosscuts several veins—one at 700 feet and another at 1200 feet from the tunnel entrance. Drifts are being run on the two principal veins crosscut and the tunnel is being pushed to cut a larger ledge which outcrops at the surface. One vein is 4½ feet and the other 9 feet wide, samples from which are reported as running from $14 to $20 per ton in copper values and from $1.20 to $4 in gold.

Arrangements have been made to erect a 60-ton concentration mill on the property, the construction to be in charge of B. W. Sweet. Messrs. Adams, Knapp & Hinckley are directing the affairs of the Kurtz-Chatterton C. M. Co.

Grand Encampment, March 28.

FOREIGN.

BRITISH COLUMBIA.

The strike in the mines of Nelson district has ended. The mines in Nelson and Ymir districts will pay uniform wages of $3.25 a day.

At Grand Forks in the Gold Drop an upraise 200 feet to the surface is in progress.

The main tunnel in the Rawhide is now in 500 feet.

The wooden superstructure of the dam across the Kettle river for the Grand Forks smelter is being constructed.

About 100 men who were employed at the Granite, Royal Canadian and Poorman mines have quit work and the mines are closed down, says the Nelson Miner. The men came out by order of the union, owing to the fact that the mine owners refused to comply with their demand for higher wages. Several days ago a deputation of twenty-five men came in to see Captain Duncan, and made a proposition to the owners to pay an increased wage. They demanded $3 a day for muckers and laborers, with a reduction of $1 from the amount they were charged per week for board. They were receiving $2.50 per day and paying $5.50 per week for board. Wednesday morning Captain Duncan visited the mines and informed the men that their demand would not be granted, whereupon, under the ruling of the union, they refused to work any longer and the mines closed down. Captain Duncan has cabled a full account of the proceedings to the London office and is awaiting instructions from there.

INDIA.

The Mysore G. M. Co., Ltd., produced gold during January to the amount of £56,916 8s 1d.

MEXICO.

The Sonora Quartz Mine Development Co. of California, of which R. G. Hart is Mgr., is working the El Tiro and Yaqui mines, Altar district, Sonora. F. L. Coombs of San Francisco is president and S. J. Hendy vice-president.

The original Cobre Grande M. Co. is in possession of the Cananea copper mines, northern Sonora. J. H. Wood is receiver.

The new smelter of the Las Animas M. & S. Co., in the Altar district of the State of Sonora, will begin this month. A fifty-ton stack is nearing completion.

Chihuahua Enterprise: The Sonora Development Co., operating the Arbabo mine near Torres, Sonora, are taking out ore averaging 1800 ounces.

SOUTH AFRICA.

A London Times South African correspondent hears that all the Rand mines have closed down and that British workmen and their countrymen in other parts of the Republic are being expelled wholesale from the Transvaal.

SOUTH AMERICA.

Platinum is reported in veins of manganese ore existing in altered or decomposed syenites near Santa Rosa de Osos, in Colombia.

SPAIN.

The dividend of 45 shillings per £5 share declared by Rio Tinto Co. on its 325,000 ordinary shares amounts to $3,656,250, the largest ever declared by that company. The previous dividend upon Rio Tinto ordinary shares was 35s per share, paid Nov. 1, 1899. These two dividends upon the Rio Tinto ordinary shares aggregate $6,500,000. For 1898 the Rio Tinto earned $6,000,000, or just about Boston & Montana earnings for 1899. About the same amount was also earned in 1897. The dividends paid out each year amounted to $4,250,000, which was 5% on 325,000 £5 preference shares and 47½% on an equal number of ordinary £5 shares. The last two dividends on the ordinary shares have aggregated 80 shillings per £5 share, or $20 per share on 325,000 shares, a total of $7,500,000, which ranks the Rio Tinto very close to the Calumet & Hecla dividends.

Personal.

GEO. J. HOFFMAN, a California mining engineer, has gone to London.

A. C. PAUL has returned from Shasta county, Cal., to San Francisco.

B. F. BUSH succeeds J. M. Fox as Mgr. Rocky Fork, Mont., coal mines.

JAMES DOUGLASS, Pres. United Globe mines, is at Globe, Gila county, Ariz.

O. P. POSEY, Gen. Mgr. Bingham Copper & Gold M. Co., is visiting San Francisco.

R. C. SURBRIDGE, Pres. Fortuna-La Republica M. Co., is in California from Boston.

THOMAS WILLIAMS of San Jose is the new Supt. Mountaineer mine, Nevada county, Cal.

BEN WILLIAMS, late Supt. Copper Queen, Ariz., has returned to San Francisco from Placerville, Cal.

A. J. WALSH goes to the island of Java to report on a mining property for the Risdon Iron Works of San Francisco.

J. H. AND W. B. DEVEREUX are examining the U. S. M. Co.'s property at Bingham, Utah. The latter is now in the directorate of the Melones, Cal., M. Co.

STATE ATTORNEY-GENERAL FORD AND EX-CONGRESSMAN CAMINETTI are in Washington, D. C., in the interests of the work of building debris restraining barriers in California.

C. J. JENNE, formerly with the Mountaineer mine, Nevada City, Cal., goes to take charge of the machine shop and electrical department of the Victor mine, Brown's Valley, Yuba county, Cal.

Industrial Notes.

—A railroad is to be built from Thornton to Bland, N. M.

—The Santa Fe road is built from Bakersfield, Cal., to San Francisco bay.

—The survey of the Central Arizona railroad has been completed from Flagstaff to Globe, 147 miles.

—Work has begun on the A. & U. extension north from Chloride, Arizona, toward the Colorado river. Camps have already been established.

—The gross earnings of the Canadian Pacific Ry. for the year 1899 were $29,230,038.26; working expenses, $16,999,872.77; net earnings, $12,230,165.49.

—At Pittsburg the price of coal advanced from 25% to 50% on the 1st. The advance is attributed to the increased wages of the miners, and the coal famine in the East and in Europe. Operators can hardly fill orders.

—Hundreds of unskilled Italian laborers are reported at the mining towns of Minnesota, employed at surface mine labor at $2 a day. Such has been the increase of wages that the cost of stripping earth at these mines has been increased to 45 cents a yard.

—The contract for building the Southwestern railroad system in the State of Ycata, Yucatan, has been let to Porfirio Diaz, Jr., son of President Diaz; he will put 3000 men to work constructing the line as soon as the Government approves the plans.

—Alabama has sold England 2,000,000 tons coal, for $1.50 per ton, delivered at New Orleans. Coal in Germany has advanced 40% within a year; the Welsh collieries can no longer supply European navies. Nagasaki, Japan, is importing coal from Virginia.

—The General Electric Co. of New York has secured control of the Siemens-Halske Electric Co., the stock of the latter corporation having been bought by the individual stockholders in the General Electric. The Siemens-Halske Co. will be conducted independently for a time, but eventually will be merged into the General Electric corporation.

—Ex-Senator Warner Miller has been in Phœnix, Arizona, looking up, on behalf of New York clients, the capabilities of the Salt river valley and the cities of Phœnix, Tempe and Mesa for financial support for a great water storage dam, to be built in the canyon of Salt river, sixty-five miles east of Phœnix, where the stream is joined by the waters of Tonto creek. It is understood he will recommend the investment of the necessary capital, approximating $2,000,000.

—San Francisco is considering a proposition made by Von Schmidt, Dillman & Hunt to bring into San Francisco, at a cost of $25,000,000 to be paid by the city, a supply of 60,000,000 gallons per day of fresh mountain water drawn from Lake Tahoe, lying on the eastern slope of the Sierras: a restraining dam to be constructed across the Truckee river, a diverting canal built to a point several miles below the dam and a tunnel run under the summit of the mountain range, to deliver the water at a point on the American river, where a reservoir would be constructed, from which the water would be conducted in steel pipes to San Francisco.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ROCK DRILL.—Russell Avery, Sausalito, Cal., one-half assigned to H. C. Campbell, San Francisco, Cal. No. 646,343. Dated March 27, 1900. This invention relates to improvements in apparatus for drilling rock and the like. It consists in means for maintaining the drill at any desired angle, and providing for means for moving it transversely, and returning it without disturbing the angle, and means for connecting the drill with the striker, so that the movement of striking the drill serves to rotate and raise it intermediate of each stroke. The object of this is to enable the hammer wielder to turn the drill without the assistance of a second man, as is shown in hand drilling, and by this connection each backward swing of the body in raising the hammer will pull upon the cord and by the connection will turn the drill.

NUT LOCK.—J. W. Stanley, Yuba City, Cal., one-half assigned to J. W. Ashley, same place. No. 646,059. Dated March 27, 1900. This invention relates to a device for locking nuts after they have been screwed upon bolts, so as to prevent their jarring or otherwise turning loose upon the bolt. It consists of a plate having holes made through it to receive the bolt, and slots cut in the ends of the plate parallel with each other and with the side edges, and forming a plurality of independent tongues which are adapted to be turned up against the sides of the nut. Similar slots are made at any point within the length of the plate so that when a nut has been put upon a bolt at such point, the edges of the strips cut away by the slots can be turned up against the sides of the nut to prevent its turning. By turning the flaps down the nut can be turned to either release it, or turn it further upon the bolt, and the flaps again turned up.

SOOT DISPERSING ATTACHMENT FOR BURNERS.—J. C. Lohmeyer, San Francisco, Cal. No. 646,054. Dated March 27, 1900. This device is intended to prevent the blackening of ceilings by smoke or soot produced from lamps, gas or other burners. In the use of lighting appliances, a great difficulty arises from the gradual deposit of soot at points upon the ceiling above the burner. This apparatus consists of a wheel having angularly placed vanes, and means for turnably suspending it above the burner so that the rising heat will cause it to rotate in a horizontal plane, and its rotation in this manner serves to disperse the soot, and cause it to pass off above the line of the upwardly moving heat, and being out of this line, it will drop harmlessly to the floor, and will not reach the ceiling.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR WEEK ENDING MARCH 27, 1900.

Commercial Paragraphs.

IN connection with the late purchase of the Pacific Rolling Mill property at San Francisco by the Risdon Iron Works of San Francisco, the latter are overhauling the bar iron rolls, and within sixty days will be rolling merchantable bar iron. This of course will necessitate the bar mills being operated continuously night and day and will give employment to a large number of men. The Risdon expect to turn out from 300 to 400 tons of material per month and thus keep a large amount of money in circulation on the Pacific coast, instead of bringing the material from the East. They have also made a start tearing down old buildings, preparatory to erecting new molding shops and boiler works immediately, which will contain the latest electrical cranes and large tools for ship and boiler construction. The Risdon Iron Works have the contract to triple-expand the machinery of the steamers Mariposa and Alameda of the Oceanic Steamship Line and the new boilers for these steamships are almost ready to be installed. When these ships lay up they will be taken to the Risdon's new shipyard and there overhauled and fitted up.

Latest Market Reports.

SAN FRANCISCO, April 5, 1900.

SILVER—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 59⅝c (1000 fine); San Francisco, 59⅝c; Mexican dollars, 48¾c. This is the way the current issue of the N. Y. Financial News argues: "Silver is one of the immediate great purchases. It should have an advance of 10 to 15 cents an ounce within the next sixty days. There is no available supply on hand, while all Europe needs it as a subsidiary coin. India and China are increasing their coinage and will need silver from now on in increasing quantities. The present output of silver is largely derived as a by-product in mining for other metals, and it is not profitable to mine for silver alone under $1 per ounce, consequently it will not take much increased demand to put the price up to the figures indicated."

COPPER.—New York: Lake, 1 to 3 casks, 17.25 cash; carload lots, 17.00; Electrolytic, 1 to 3 casks, 17.00; carload lots, 16.75; Casting, 1 to 3 casks, 16.75; carload lots, 16.50. San Francisco: 17¼@18. Mill copper plates, 21½c; bars, 23½@25c. The New York exports of copper for the first twenty-nine days of March were 16,261 tons, breaking the record for any month in the history of the trade. The largest export record before this was in September, 1893, when shipments of 16,131 tons were made. The normal exports are 11,500 tons per month.

LEAD.—New York, $4.72½; St. Louis, $4.60; San Francisco, $4.95; pipe 7½, sheet 8¾, bar 6½c. London, Soft Spanish Lead, £16 12s.

SPELTER. — New York, $4.55; St. Louis, $4.40; San Francisco, ton lots, 6c; 100-lb lots, 6¾c.

ANTIMONY. — New York, 9½c; San Francisco, 1000-lb lots, 11c; 300 to 500 lbs., 12@14c; 100-lb lots, 15@18c.

BABBITT METAL.— San Francisco, No. 1, 10c.

PHOSPHORUS.—F. o. b. New York or Philadelphia, 50@55c ℔ lb.

SOLDER. — Half-and-half, 100-lb. lots, 21½c; San Francisco, Plumbers', 100-lb. lots, 18½c.

IRON. — Pittsburg, American soft—pig—large lots—$25.25; Scotch, $26.50; San Francisco, bar, per lb., 3½c.

STEEL.—San Francisco, bar, 12c to 20c per lb.

QUICKSILVER. — New York, $51.50; London, £9 12s 6d; San Francisco, local, $51.50 ℔ flask of 76½ lbs.; export, $47.50.

PLATINUM.—San Francisco, crude, $16 ℔ oz.; New York, $18; manufactured, $19.50@22.00.

FERRO-TUNGSTEN.—New York, 60c; San Francisco, 75c (60%).

FERRO-MANGANESE. — Pittsburg, $125.

MAGNESIUM.—New York, $3.50 ℔ lb.; San Francisco, $4.50.

ZINC.—San Francisco, 6c; slab, 6½c; bar, 8c.

TIN.—New York, pig, $32; San Francisco, ton lots, 34c; 1000 lbs., 34½c; 500 lbs., 35c; less, 36c; bar tin, ℔ lb, 40c.

ASSAY LITHARGE.—San Francisco, 10c ℔ lb.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 40c to 50c.

NICKEL.—New York, 40@45c ℔ lb.

BISMUTH.—New York, ℔ lb., $1.80 50-lb lots; San Francisco, $2.50 to $3 lb lots.

TUNGSTEN.—New York, ℔ lb., 75c; San Francisco, 90c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

FUSE.—Triple tape, $4.35 per 1000 feet; double tape, $3.70; single tape, $3.45; Hemp, $2.55; Cement No. 2, $3.70; Cement No. 1, $2.95.

CANDLES.—Granite 6s, 16 oz., 40s., 12c ℔ set; 14 oz., 40s., 11c.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 33@35c ℔ lb.; carloads, 30@31c; in 10-lb. tins, 40c; sulphuric acid, 1¾c ℔ lb. 66% B; soda ash, $1.60 ℔ 100 lbs. 58%; hyposulphite of soda, 2¾@3c ℔ lb.; blue vitriol, 5½@6c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.00; sks, 95c ℔ 100 lbs.; chloride of lime, spot, $2.35@2.50; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, strictly pure, boiled, bbl., 68c; cs., 73c; raw, bbl., 66c; cs., 71c. Deodorized Stove Gasoline, bulk, 16c; do., cs., 22c; 86° Gasoline, bulk, 21c; do., cs., 27c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 15½c; do., in cs., 21½c; Lard Oil, Extra Winter Strained, bbl., 60c; cs., 65c; No. 1 bbl., 47½c; cs., 52½c; Neatsfoot Oil, coopers' bbls., 60c; extra bbls., 55c; cs., 60c; No. 1 bbl., 52½c; cs., 57½c.

COAL. — San Francisco coast, yard prices: Wellington, $8; Seattle, $7; Coos Bay, $5; Southfield, $7.50. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.50; Scotch, $8; Cumberland, $9; Cannel, $9.50; Welsh Anthracite, $12.50; Rock Springs, $10.05; Colorado Anthracite, $14.50.

SMOOTH-ON CASTINGS.

An iron cement in powdered form, for repairing leaks or fractures in steam or hydraulic work, applied by mixing with water; hardens quickly and expands in hardening. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

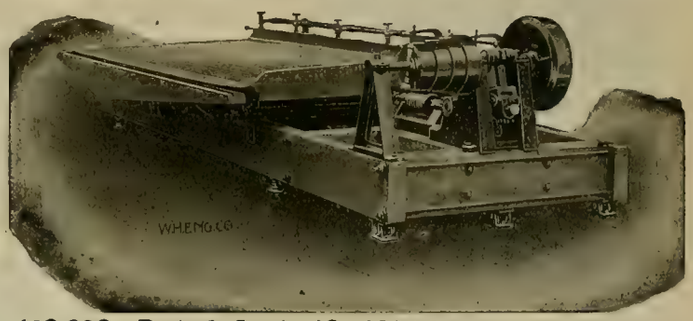
THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.



SEND FOR FREE ILLUSTRATED AND DESCRIPTIVE CATALOGUE TO

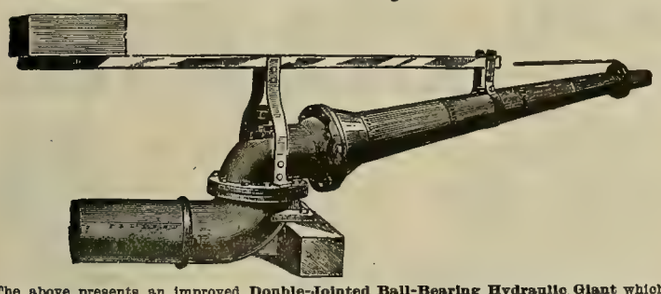
Up-to-date Miners who value their lives use
McINTYRE'S DRY BATTERY
PORTABLE ELECTRIC SAFETY LAMP.
ABSOLUTE SAFETY is Assured All Users.

NO. 1 LAMP.

This is an Electric Lamp set in a White Enamel Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick-pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket. So the user has free use of hands. The current can be turned off when not in use. Dry batteries are used and can be recharged from direct Incandescent Electric Current. Charger and full directions go with each Lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Oil and Gas Works Employes, Powder Mills and Warehouses where explosive materials are manufactured and stored, where it is impossible to carry an oil lamp or candle for fear of explosion, and all parties requiring a safe portable light. The whole outfit is neat and compact.



No. 1 weighs	2 lbs.,	1½ C. P.	Price complete,	$4.50.	For meter reading only.
No. 2 "	3 "	4 "	" "	6.00.	For Miners and general use.
No. 3 "	12 "	10 "	" "	12.00.	For several persons to work by.
No. 4 "	3 "	4 "	" "	6.00.	Boiler Makers and Chimney Sweeps.

THE COLORADO IRON WORKS CO.

ESTABLISHED 1860. DENVER, COLO.

—MANUFACTURERS OF—

Smelting Furnaces and Equipments

: : : FOR THE TREATMENT OF : : :

Gold, Silver, Lead and Copper Ores.

We build furnaces to drawings and specifications, and furnish drawings and full instructions for erecting.

We erect all furnaces at our works and carefully mark every piece before shipping. By this means, trouble in erecting at the smelting plant is entirely avoided.

We contract to build and equip smelting plants complete, of any required tonnage capacity above forty tons per day, at any desired location and put them into successful operation under guarantee. We contract to smelt a thousand tons of ore, mroe or less, before turning the plant over as completed under the guarantee.

We have in the past built more Blast Furnaces for smelting the ores of the valuable and the precious metals—gold, silver, lead and copper—than any other manufacturing concern on the American continent, and in the past year of 1899 we built more such furnaces than all others combined.

CAPACITY OF WAGONS 16 TONS EACH, or total freight carrying capacity of train 50 tons.

CAPACITY OF ENGINE, 50 H. P.

THESE WAGONS ARE ESPECIALLY DESIGNED FOR STEAM FREIGHTING.

CAPACITY OF TRAIN, 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the world. Eighty of them in use on this Coast. They are being Successfully and Profitably Employed in Hauling Logs, Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend grades as much as 10% to 20%, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on a firm and moderately level road.

P&B BUILDING PAPER

The walls of a house are built for protection. If the sun and weather open up the sheathing, the rain or the air will get in and cause discomfort and doctor's bills. To prevent this the architect or builder uses building paper. There are many kinds, but only two classes—the poor and the good. P & B PAPER is good—the best. It is very strong, odorless, waterproof and airproof, and will not rot. Ask your dealer for samples, or write us for them. We are the makers.

PARAFFINE PAINT CO., San Francisco, 116 Battery St.

MINING AND MILLING MACHINERY.

DOUBLE CYLINDER SINGLE DRUM HOIST.

THE above form of Hoist has certain features of construction which make it superior to all others. It is mounted on a single solid base, with standboard for the operator. The engines are reversible link-motion and the drum is fitted with post-brakes and helical teeth, which assure quick and safe operation. The design is compact and superior and the construction strong and substantial. We furnish them either with or without clutch pinions. The above cut illustrates an 8½ inch by 10 inch. Other sizes in stock and built to order.

ASSESSMENT NOTICES.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2nd day of April, 1900, an assessment (No 23) of 2 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of May, 1900, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 28th day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

SOUTH PALOMA GOLD MINING COMPANY, Limited.—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of March, 1900, an assessment (No. 2) of six-tenths (6-10) of a cent per share was levied upon the capital stock of the corporation, payable immediately to the secretary, John F. Barnett, at Room 22, No. 222 Sansome St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23rd day of April, 1900, will be delinquent and advertised for sale at public auction; and unless payment be made before, will be sold on MONDAY, the 14th day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOHN F. BARNETT, Secretary.

Office—Room 22, No. 222 Sansome St., San Francisco, California.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3d day of April, 1900, an assessment (No. 16) of Ten ($10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of May, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 5th day of June, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

CONSOLIDATED CALIFORNIA AND VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of March, 1900, an assessment (No. 15) of twenty cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room No. 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of April, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 1st day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room No. 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of March, 1900, an assessment (No. 11) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 773 Mission St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of May, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 26th day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California.

OSCEOLA CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Plymouth, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of March, 1900, an assessment (No. 9) of one (1c) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 307 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of April, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

HOLLAND SMITH, Secretary.

PATENT SOLICITORS,

330 MARKET STREET, - SAN FRANCISCO, CAL.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.**

Powell's Signal Oiler.

LEVER UP, Oil Dropping;
LEVER DOWN, Oil Shut Off.

Doesn't interfere with the adjustment.
Most perfect Oiler in the world.

See our PUMPING PLANTS.

The Lunkenheimer "Clip" Gate Valve.

Single Disc
DOUBLE SEATED.

Made with Screw Ends from ¼" to 6", Flange Ends 2" to 6" sizes.

BEST IN QUALITY.
LOWEST IN PRICE.
THE ENGINEERS' FAVORITE.

These Valves are made of cast iron and all wearing parts of gun metal. They are superior to the common, cheap, brass valves with which the market is flooded.

WHY?

BECAUSE they possess all the advantages of a cast iron pipe fitting (Elbow, Tee, Coupling, Union, etc.) namely—are heavy and rigid—not injured by expansion and contraction or rough handling in pipe fitting. TAKE PRESSURE FROM EITHER END. Body and hub are held together by a steel clip, consequently always easily taken apart. Joint between body and hub made permanent by an imbedded seamless oval copper wire washer. If you desire the BEST, STRONGEST and MOST DURABLE valve for general purposes on all ordinary pressures, use this valve. IT IS A STANDARD FITTING, OF NEAT APPEARANCE and FULLY WARRANTED TO SATISFY. Made also in All Iron for Cyanide Plants. Try them and be convinced. Specify them and order through your dealer. Our Catalogue of superior Steam Specialties FREE for the asking.

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

THE "JAMES" AUTOMATIC ORE FEEDER.

THE "JAMES" ORE FEEDER,

as illustrated on this page, is a machine of improved design for the automatic feeding of ores to stamp batteries and other crushing machinery. It is perfectly adjustable while in operation, and will feed equally well ores wet or dry, coarse or fine.

Shipping weight, with wood frame, - 800 pounds.
" " " iron " - 1000 "

ADVANTAGES

The advantages of this ore feeder, over any others that are in the market, are, that the feed is positive and will not gig back no matter how slight the motion to the arm; it can not possibly spill ore of any character and will definitely measure out from one to fifty tons per day of any class of ore.

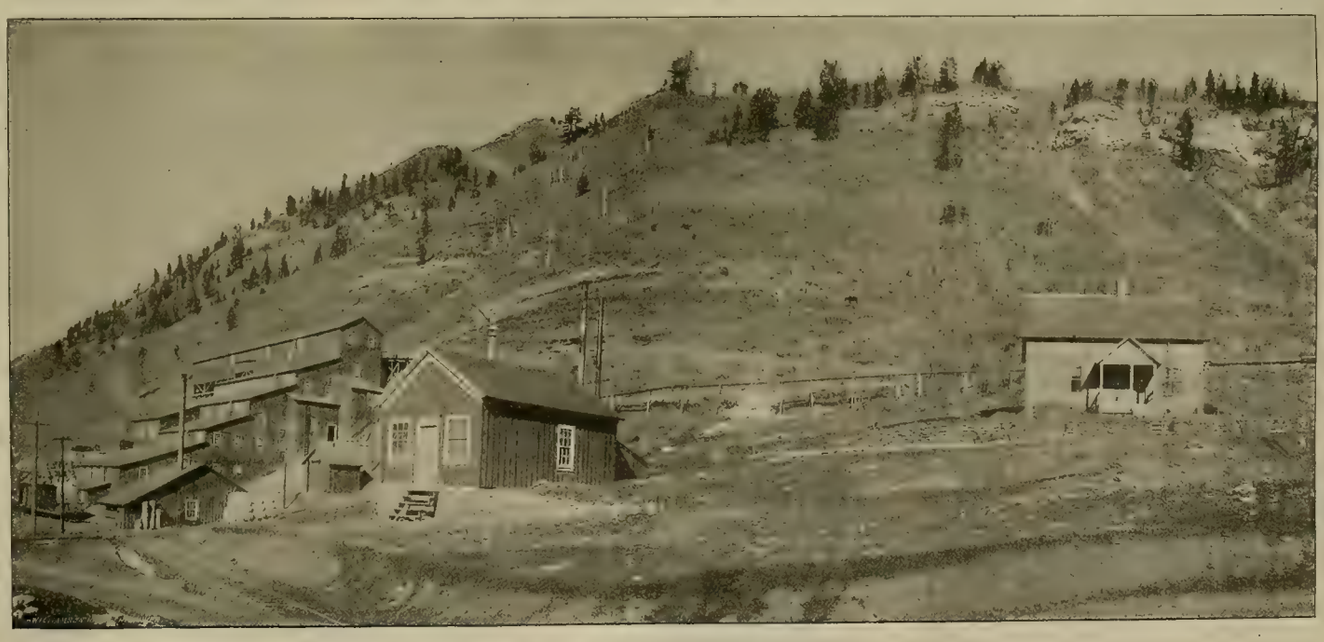
No. 2073.—VOLUME LXXX. Number 15. SAN FRANCISCO, SATURDAY, APRIL 14, 1900. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.



The Liberty Bell Mine and Mill, Colorado.

The Liberty Bell G. M. Co., at Telluride, in the San Juan mountains, San Miguel Co., southwestern Colorado, is fairly illustrative of mining progress in that section. The mines are two miles north of the town of Telluride; the mill is situated in the valley half a mile above town, connection being had with the mine by a tramway two miles in length with a daily transportation capacity of 480 tons ore. As the ore comes from the mine it is dumped into a bin, thence automatically fed over grizzlies, the coarser ore going direct to the crushers, the finer passing through the screen and conveyed by chutes to bins, where it is followed by the ore discharged from the crushers. From this bin the ore is automatically loaded into the tram buckets and conveyed to storage bins at the mill, whence it drops by gravity into automatic feeders, thence into the batteries where 850-pound stamps crush it, thence the pulverized ore passes over copper amalgamating plates, the entire product being concentrated.

At the opening of last year a 20-stamp mill had just been completed, and the property put in shape for experimental purposes. During the year the Liberty Bell employed sixty men at the mine, six at the mill and fifteen in construction work. As is the case with most mines of that district, the tailings from the amalgamating and concentrating tables carry away with the waste a considerable value. Last summer the company constructed a retaining reservoir, where the tailings flow was held and settled. Tests of these tailings demonstrated that their retreatment would yield a profit, and it was determined to construct a plant for that purpose. The improvised retaining reservoir being exhausted, the company on December 1st shut down the mill and suspended mining until the tailings plant could be completed. When this was done, work began upon a plant for the treatment of the tailings as they come from the mill, by the cyanide process. In the interim, pending the completion of the plant, development was being pushed wherever it was possible to open up new ground. A jig-back tramway 1000 feet in length, with a capacity for handling ten tons of ore per hour, was put in to carry ore from the Gold and Silver Chief level down to the main loading terminal of the tram to the mill. An electric power line was constructed from the mill to the mine, and an electric motor, 40 H. P., for furnishing power at the mine. The mill was doubled in size and capacity, twenty stamps being added to the twenty in operation a year ago. The mill has now been doubled again. Forty stamps more, with the necessary vanners and concentrating tables, are now in operation, with an additional electric motor, 40 H. P., for the mill. A spur has been laid from the Rio Grande Southern track into the mill yards. The construction of a cyanide plant, capacity of 300 tons per day, for the treatment of tailings has been completed. The mill now has a capacity of 300 tons per day of twenty-four hours, the process being amalgamation and concentration. The tailings plant, where the process is cyanide, has the same capacity. At the mine stoping has been carried on in three levels; the mine has produced and the mill treated 24,000 tons of ore, the product being in bullion and concentrates, development being continuously carried on. A total of 3000 feet of drifts, in which the vein is exposed, have been run, and the lower levels connected by raises. The company's headquarters is at Kansas City, Mo.; A. E. Stillwell, Pres.; Arthur Winslow, Gen. Mgr. and Cons'g Eng'r; W. Mercer, Res't Mgr. and Supt. To the Journal of Telluride we are indebted for the accompanying illustration.

IN the issue of March 17th appeared the full text of the senatorial bill according federal aid to mining schools. This week the Senate Committee on Mines and Mining reported the bill in a modified form, providing for the utilization of a part of the proceeds of the sales of public lands in support of schools for mining in the public land States. It provides for the appropriation of $10,000 annually for the present in each case and the gradual increase of the amount to $20,000. By favorable and concerted effort in behalf of the measure, it stands a good chance of becoming a law at this session of Congress.

THERE is a coming together and a growing feeling of kindliness between the geologist and the miner, though many miners are still prone to affect contempt for the geologist, his methods, his opinions and his work. In this age of scientific mining, both geologist and miner can well work together, for together their best work lies. There is need of such mutual trust and assistance and mutual profit therein. They can supplement and complement each other. While, of course, a real miner will never have any other feeling than one of ill-concealed contempt for the charlatan—the pretended geologist who has learned a lot of names of rocks and knows little else—the real geologist who can collect his deductions and facts from the miner, who has a wide range of observation and reasons with accuracy, can be of material aid to the miner. Both are working for material success, and in this, as in other branches of business, knowledge is power.

FLOODS totally destroyed the great dam at Austin, Texas, last week, occasioning the loss of sixty human lives and about $2,000,000 direct damage. Its faulty character of construction was editorially pointed out in the issue of July 29th, '99. Holding post mortems is always unpleasant, but it is to be said that too much care can not be exercised by engineers in the plans and construction of such structures, and the expenditure of $100,000 more in proper placing of contracts sometimes saves millions, as in the case cited. That the dam was faulty was long known to engineers, and many were more sorry than surprised at the news of last week's disaster. The dam was 66 feet above foundation, 60 feet above low water at its foot; crest was 5 feet broad, inner top corner rounded off to radius of 6 feet. The down-stream face curved with a radius of 20 feet for about 70°, thence the face was straight with a slope of 3 on 8, ending with a second curve of 31 feet radius back to a horizontal line. The up-stream face was vertical. The material was granite rubble, with all faces finished in cut granite. The maximum flood discharge was estimated at about a quarter of a million second feet. The cross section seemed sufficiently heavy, and it seems impossible it could have failed as at first reported by cracking parallel with the base at a point about 25 feet down. A later report is of a crest depth of 10 feet (about 120,000 second feet) and that the dam failed by two sections near the center moving bodily down stream. This sliding on the base seems more probable than the first reported manner of failure but yet inexcusable from an engineer's point of view.

Stamp Mill Practice.

There is constant comparison and discussion of what for convenience may be termed distinctively California and Colorado stamp mill practice—in the former State the heavy quick-drop stamp and shallow mortar; in the latter the light slow-drop stamp and deep mortar with high issue. The Gilpin county slow-drop mill, a 500-pound stamp, dropping 16 inches thirty times a minute, with a deep mortar, an amalgamator as well as crusher, is typical of Colorado practice: the quick-drop 1100-pound stamp dropping 6 inches 100 times a minute, a coarse crusher, is typical of California practice. But as the Gilpin county bumper now divides the work in many a Colorado mill with other vanners or concentrating tables, so the slow-drop stamp now has considerable company of rapid drop.

The question is not one of expediency nor policy, but of results: whether it be Clear Creek or Gilpin Co., Colorado, or Nevada or Tuolumne Co., California, the millman aims to constantly suit the ore, and it is to be recognized that the gold ores of the two sections differ greatly. The ores of California, until considerable depth is reached, are mainly quartz and schists containing free gold: this the heavy stamp cracks rather than crushes. The surface ores of Colorado are not entirely dissimilar, but the oxidized part of the Colorado vein extends downward a comparatively short way—often less than 100 feet—while the oxidized area of the California vein is often found extending downward to a depth of 700 feet. The sulphide ores of Colorado are deemed by many millmen to need fine crushing and introduction of amalgamated plates inside of the mortar for successful extraction of gold by amalgamation, though this fine crushing entails a greater amount of slimes, which frequently carry off so much gold.

The California ore, which rarely carries more than 4% sulphurets, admits of coarser crushing, and consequent less dependence on amalgamation in the mortar. The tendency in California is toward increased stamp duty, now reaching a maximum of 5.5 tons per stamp per twenty-four hours. The present Colorado tendency is toward an increase rather than a decrease in the number of heavy rapid-drop stamps. It is noticeable that whenever an old mill is torn out at Black Hawk or elsewhere, and a new mill put in, the new battery is of considerably greater weight than the old.

With intent of amalgamation, some of the mills in Gilpin and Clear Creek counties, Colo., have two plates inside the mortar—one back plate and one front plate—put just below the discharge screen. The inside plates are generally arranged so that their upper edges are level with the pulp in the mortars, from 1½ to 2 inches above the surface of the dies. With the mortar the rear plate is usually 12 inches and the front plate 6 inches wide. The outside plates are the same width as the mortar—4 feet 7 inches; they vary in length from 6 to 16 feet.

In California practice the rear plate is 9 to 10 inches wide, of the same length as the mortar; the front plate is 4½ inches wide, and of the same length as the mortar. This plate is inclined from 10° to 20°; the rear plate inclined about 40°, depending on the shape of the mortar. An apron plate 2 or 3 feet wide is interposed between the battery and the table plates, there being a drop of 2 or 3 inches from the apron plate to the table plate. The plates are fastened to solid wooden tables, with raised sides, about 6 inches high. In California the table plates have an inclination of 1½ or 2 inches per foot, the apron plates an average inclination of 1½ inches. In Colorado, where, as noted, the ores are more heavily sulphuretted, these have an inclination of from 2 to 2½ inches per foot. It is this difference in sulphides that occasion the differences noted above in stamp mill practice throughout, as herewith detailed, in the two States.

A Colorado millman, working continuously in one locality and never traveling around, would be as much surprised at some things in California mill practice as a California millman, similarly circumstanced, were he to spend half an hour in some Colorado stamp mills.

As to which is "the best," it can only be said, as in everything else connected with the treatment of ore, that, from a commercial standpoint, that is the best process that pays the best.

Of course, taking even this criterion, there is manifest room for improvement. The two types discussed in this article are considered distinctively superior to some that might be cited, not for invidious or disparaging comparison, but by way of illustration, as some Australian mill characteristics, a crude design for mortar, the cam shafts not driven direct by belting, but run by tooth gearing, fifteen or twenty stamps actuated by a single cam shaft so geared, the tappets fixed and adjusted by screw-threads cut on the stem, eighty drops per minute considered rapid work, chilled iron shoes and dies instead of steel, and other characteristics that would indicate what might be mildly characterized as extreme conservatism. Yet, possibly, an Australian millman "bossing" things in one mill for twenty or thirty years would be indignant were it suggested that he was not up-to-date in stamp mill practice.

World's Production of Precious Metals.

The International Economist of Berlin gives an analysis of the world's production of precious metals. But for South African disturbances the production of gold in 1899 would have broken all records. As it is, the total yield reached about 970,000 pounds. After peace is restored in the Transvaal, the Rand and other African districts will produce 5,250,000 ounces, or double the production of 1897. With the increase from the United States, Australia and Canada, the twentieth century will commence with a yearly production of over 1,000,000 pounds. The German paper considers false the contention that the gold supply is insufficient, and that the present high price of money represents a consequent enhancement of the price of gold. Since 1871, when Germany abandoned the silver basis, the world has produced 13,500,000 pounds. From the discovery of America to 1871 the production only slightly exceeded 19,000,000 pounds. Within the last twenty-eight years the production was equal to two-thirds of the production of the four preceding centuries. Nevertheless, from 1492 to 1871 there never existed any fear of an insufficient gold supply. During the Californian and Australian discoveries, when the supply of gold increased 2,300,000 pounds, Chevalier preached a demonetization of gold; from 1894 to 1899 there has been an output of 4,600,000 pounds.

The production of silver does not decrease. The recent production of silver by ounces in the leading countries has been:

Country—	1898.	1897.	1896.

The world's production during 1899 is estimated at over 170,000,000 ounces.

AS COMPARED WITH other hazardous occupations, mining does not show extraordinary fatality. The Pennsylvania State Bureau of Mines and Mining has published statistics which show that in that State during the past thirty years 9575 lives have been lost in the mines. Between 1870 and 1879, inclusive, for every 1000 persons employed a percentage of 3.839 persons lost their lives. In the second decade, from 1880 to 1889, for every 1000 persons 3.210 persons lost their lives. In the third decade, 1890 to 1899, for every 1000 persons employed 3.140 lost their lives. The most noticeable features about these statistics are the fact that despite all the improvements in mining methods the percentage of fatalities has not diminished, and that such percentage continues during thirty years to be so remarkably uniform. It is believed that were similar data procurable for any metal mining region it would show a much smaller death percentage than the figures from the Pennsylsylvania coal mines.

Concentrates.

THE Ingersoll-Sergeant rock drill was patented May 30, 1871.

A SATURATED solution of salt boils at 226° F., under ordinary atmospheric pressure.

THERE is no State tax on the issue of certificates of stock of California stock corporations.

THE H. P. of 1 inch of water with 100 feet fall is .24147; of 40 inches, same fall, 9.6588.

THE convention of the Northwestern Miners' Association will be held in Baker City, Or., next June.

THE "miner's ton" in Great Britain, for weighing ores and mattes, is 21 cwt. of 112 pounds each, or 2352 pounds.

THE date of the meeting of the International Mining Congress at Milwaukee, Wis., has been changed to June 26–30.

PROMETHEUM or titan metal is an alloy of 60% copper, 38% zinc, 2% aluminum. A very little sodium is added when molten.

SILVER has been produced by the cyanide process at Mercur, Utah (the Chloride Point mine) at a cost of 23 cents per ounce.

THE gas consumed in one 16 C. P. gas jet, if consumed in a gas engine, would produce three 16 C. P. incandescent electric lights.

IN silver halves, quarters and dimes $1000, U. S., weighs 803.75 ounces; in standard silver dollars $1000, U. S., weigh 859.375 ounces.

THERE is plenty of pumice stone in Sonoma county, Cal., and in Utah, but no local demand, and freight rates preclude competition with ballast importations.

SINCE July 1, '98, each placer mining location is considered as a separate claim in U. S. patent proceedings, upon which is required $500 in work or improvements.

BUT one discovery of mineral is required to support a placer location, whether it be of twenty acres by an individual, or 160 acres or less by an association of persons.

TESTS of mining ladders show that the weak ladder is the very dry one; the most dangerous ladder is the damp one; the strongest ladder the new one put together with cut nails.

A "BRITISH THERMAL UNIT," B. T. U., is the quantity of heat required to raise the temperature of one pound of water 1° F. at its temperature of maximum density, 39° F.

QUICKSILVER has sold for $1.55 per pound in California in '75; in '79 it sold for 33 cents per pound in California. At present it is sold per flask at the rate of 67½ cents per pound.

MANGANESE steel (13% of manganese) is not magnetic, and of all the alloys of iron it is the one which presents the highest electrical resistance. There is a second allotropic variety, which is magnetic.

IT is a theory of some metallographists that solid metals evaporate from their surfaces, as camphor evaporates, while remaining solid, so that were one endowed with a finer sense of smell he could smell metal at a distance.

THE carat, the unit of weight for precious stones, carbons, etc., is 3.2 grains, varying slightly according to different localities and authorities. The international carat is 3.168 grains, or 205 milligrams. Francisco de Mello, Rua Cons. Dantes, Bahia, Brazil, deals in carbons.

WHERE water on public land, subject to appropriation, flows in a stream, any one may appropriate any of the flow not already appropriated; but no one so appropriating it can legally diminish or interfere with the full supply of a prior appropriator.

THE term "apex" does not mean a point, when used in connection with mining lodes. It means the top of the ledge or lode, the point which comes nearest to the surface of the ground. The part from foot wall to hanging wall at the top of the lode nearest the surface is the apex.

THE best practical education is that which makes intelligent labor most financially productive. Life being short, it were better to be a specialist than an "all-round" man, for now-a-days the man who "can do most anything" can do no one thing well, and is not in demand.

THE water storage required to produce 1 H. P. for one hour, with an available head of 10 feet, would be represented by the capacity of a tank 20 feet square and 10 feet deep; at a head of 140 feet the storage tank would still be required to be 10 feet square and about 3 feet deep.

IN case the owner of a quartz mill or reduction works is not the owner or claimant of a vein or lode, the law permits him to make application therefor in the same manner prescribed for mining claims, and after due notice and proceedings, in the absence of a valid adverse filing, to enter and receive patent for his mill site at $5 per acre.

COMPRESSING the gas and air mixture in a gas engine produces quicker combustion and greater explosive pressure. A 30% compression will produce more power than a 15% compression, but there is probably a limit to the economy of compression by its increasing the negative pressure. The relative volumes of gas and air also have a controlling effect in compression gas engines. One part gas to six parts air gives the highest efficiency in the higher compression, probably up to three atmospheres. The heat of compression also favors rapid and perfect combustion.

PLATINUM has never been found in place in California, but is not uncommon in northern California in both recent and older gravels, and in eroded channels in the serpentine in connection with gold, from $\frac{1}{10}$ to $\frac{1}{2}$ of 1% of the weight of the gold, though in the case of black sand containing gold the platinum percentage is often much higher.

OWNERS of valid mining locations made and held in good faith under the mining laws of the United States and the regulations thereunder, are authorized and permitted to fell and remove from such mining claims any timber growing thereon, for actual mining purposes in connection with the particular claim from which the timber is felled or removed.

COLORADO MEN claim that the Enoch shaft on the Pactolus property, Cripple Creek district, was recently "salted" by the scientific method of "squirting chloride of gold" on the quartz containing the ore proffered for examination, the experts refusing to be deceived thereby, though the immediate effect of the salting upon the local stock market was unsatisfactory—to the buyers.

FOR coarse jigs the usual length of the sieve is 28 to 36 inches, and the width 22 inches; for fine jigs the width seldom exceeds 18 inches. The sorting action of a jig depends upon the length of the piston stroke, the number of strokes per minute, the supplies of ore and water, and the discharge of the tailings, and of the concentrates. These are variable factors, according to the character and class of the ore, and the required products.

WHEN a locator locates crosswise of his vein his "side lines" become end lines, and his true side lines must be laid with reference to the ascertained course of the vein—parallel with and not more than 300 feet on each side of the center of the vein. If the width as originally marked is excessive, the excess should be discarded, so that the middle of the vein shall be in the center of the location. The area thus excluded is subject to appropriation.

NO ONE can answer the question "What is electricity?" Scientists think they have reason for belief that we live in a medium which conveys to and fro, or periodic, movements to us from the sun, that these movements are electro-magnetic; that all the transformations of light and heat, and, indeed, the phenomena of life, are due to the electrical energy which comes to us across the vacuum which exists between us and the sun—a vacuum which is pervaded by the ether, and which is a fit medium for the transmission of the electro-magnetic waves.

TO ASSAY copper borings or matte for gold, one method is to take an assay ton of the material in a No. 5 beaker. The sample is treated with a mixture of 100 c.c. water and 50 c.c. nitric acid of sp. gr. 1.42. When the violent action has ceased 50 c.c. more of nitric acid is added and the solution heated until everything soluble is dissolved. It is then boiled until the free nitric acid is expelled; then is diluted with 400 c.c. water, 5 c.c. sulphuric acid and 10 c c. concentrated solution of acetate or nitrate of lead. The precipitate of lead sulphate is allowed to settle, filtered and washed, and the filter and its contents are partially dried, wrapped in thin lead foil and transferred to scorifiers. Cupellation is conducted in the usual manner.

REGARDING the Evans hydraulic elevator pump used on the Comstock, the Risdon Iron Works of San Francisco, operating it, started in at the 750-foot station, which is a few feet below the level of the Sutro tunnel, and pumped the water out of a chain of mines extending over an area of about four miles long and one mile wide, lowering the water to a distance of about 400 feet below this point and pumping, approximately, 4500 gallons per minute for the past year. They used at various times since commencing the work 100 to 150 inches of water, of 1½ cubic feet. "Concentrates" does not know of any other part of the world where a hydraulic elevator has been used under such a lift as on the Comstock.

U. S. ENGINEERS and others figure that in parts of California's Sierra foothills, notably near the Forest Hill divide in Placer county, there are great gold placers to be mined by the drift method, the gold to be got out from under the lava. The channels of the old rivers under this capping are much richer than those of the modern rivers and placers that yielded a thousand million dollars in gold. This because the channels of the ancient rivers had served as bedrock sluices for untold ages before the disturbing lava flows began. The present rivers of California received the greater part of their gold by cutting across and carrying away great sections of the rich channels of the ancient rivers. In this way sections of the ancient channels, miles in length, were carried away and redeposited, as is to be noted at the canyons of the present river system. Thus the ancient channels, which have a north and south course, are left lying in sections between the present rivers, which run from east to west.

QUANTITY and pressure or their equivalents are the prime factors or makers of all forms of energy. If water is to exert power, one is always first concerned about the head of pressure and the volume at his disposal, for if he had a head equal to 1,000 feet, but only a supply of one gallon per hour, at this enormous pressure and small quantity the power would be no greater than when the volume was 1,000 gallons an hour with a pressure of 1 foot of head. In the same way if steam is supplied at a pressure of 300 pounds on the square inch, with a volume of only 1 cubic foot per minute, it is manifest that the power at one's disposal is here also small. On the other hand if 1,000 cubic feet of steam per minute are available at a pressure of 300 pounds on the square inch, then the power is great. What is true of water, steam and air and all other mediums of transmitted energy is equally true of transmitted energy through metals, as in the case of electricity, for in it volts constitute the factor of pressure, and amperes constitute that of volume.

GOLD is extracted from sulphurets at a profit by wet process or by fire process. The wet ordinarily includes chlorination or cyaniding with their several combinations; in smelting or the "fire process" the gold is absorbed by metallic lead or copper sulphide if the gold sulphurets and either of those are brought in contact melted, there being two products, slag and lead, the latter absorbing the gold, or slag and copper matte, which has combined with the gold. In one case the gold is liberated by electric refining or by turning the matte over to the lead blast furnace, where the iron of the matte acts as a flux, the lead combining with the gold, which undergoes the final process of separation and refining. The better plan, wet or fire, the cost of each, how closely the gold values may be extracted, can only be determined by local circumstance and requirements. The subject has been treated in fullest detail in these columns and is among the most interesting and important of all metallurgical questions.

CRACKS in cast iron cylinders may be closed in the following manner: The cylinder is filled with a certain quantity of perchloride of iron. The liquid is then compressed until globules appear on the external surface. The cylinder is then impregnated with perchloride of iron right through, as regards its thickness. Any perchloride in the cylinder is then emptied out, the cylinder being then wiped until the polished surface is again made brilliant. It is then filled with ammonia at 22° Baume, this also being subjected to compression. The effect of this operation is soon noticeable. The perchloride of iron in the metal becomes transformed under the influence of the ammonia into hydrated oxide of iron, at first somewhat frothy in character, and afterward, under the influence of the external pressure, rough and compact. Some hydrochlorate of ammonia also remains, which will soon afterward react on the iron, which will eventually be converted into an oxide compound, adding itself to the first. The leaks marked at the commencement of the operation will be entirely stopped as soon as the ammonia commences to move out externally.

METALLOGRAPHY treats of the structure and forms of the various constituents of metals and alloys and the changes in these forms brought about by external influences. The study of the relations which exist between the arrangement of the constituents of a substance and its physical properties is also a part of the science. An alloy which is to be investigated is first polished and then treated with an acid which attacks its different constituents unequally. An uneven surface is thus obtained, from the study of which definite knowledge as to the nature of the substance under investigation can be attained. The application of the methods of metallography to the study of the industrial alloys and particularly to the investigation of iron and steel has yielded important results. Two steels of the same chemical composition may have entirely different physical properties, depending on the treatment which the metal has received in the course of manufacture. Hammering, rolling, overheating, burning, etc., have a marked effect on the sturcture and consequently on the physical properties of the steel. These different forms of treatment, as well as the inclusion of slag and flaws, which are often the cause of serious accidents, are revealed by a microscopic study of the etched metallic surface.

ALTERNATING electric current apparatus is advantageous for the development of high voltages, because commutation is not necessary, and alternating current with any pressure or voltage can be readily transformed to any other voltage without the use of moving mechanism. While no exact definition of electricity or magnetism is possible, there is a definite mathematical relation between the two, as it is positively known that when an electric conductor is subjected to the influence of a variable magnetic field an electro-motive force is generated in such conductor, proportioned to the rate of change in magnetism. If, therefore, a conductor carrying alternating current be wound on an iron core, the continual change in the rate of magnetism, due to the reversals in the direction of the current, tends to cause counter electro-motive forces, which are antagonistic to, and tend to hold back the original or primary current and at the same time tend to produce current in another conductor wound parallel to the first, or on the same core. Calling the circuit carrying the primary current the primary, and the parallel current the secondary, the voltage in the secondary circuit may be made any proportion of that in the primary by simply varying the number of turns, but the work done in each will be the same, less ordinary losses. For instance, 10 amperes at 100 volts in the primary will in a secondary containing $\frac{1}{10}$ the number of turns give 100 amperes at 10 volts. This is called step-down transformation, because the pressure is reduced. If, however, the primary contains a fewer number of turns, the pressure in the secondary is increased, which is called step-up transformation. It will be observed that this operation is performed without moving parts, the variations in the strength of the current producing results akin to those resulting from the motion of the conductors of an ordinary armature across a magnetic field.

Scrip and Law of Title to Oil Lands.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by A. H. RICKETTS.

It has always been the settled policy of Congress to exclude the mineral lands from the operation of the general land laws—that is, from grants of land to States or railroad companies, from pre-emption or homestead entry, etc.—but it is well known that large areas of mineral land in this and other States have been patented as non-mineral land. This is largely due to the fact that heretofore in the majority of cases the application has been granted upon a purely exparte showing agreeing with the classification of the land made by the surveyor when surveying the land. The passing of the absolute title of the Government to the applicant for either class of land is confided to the land department, whose determination of the character of the land when evidenced by the patent, whether right or wrong, is conclusive, in all courts and places.

The character of land patented as agricultural land is not changed in the eyes of the law by subsequent mineral discovery therein, and vice versa. Any person going upon such land for the purpose of prospecting the same for mineral, without the consent of the owner, is a mere trespasser. He can initiate no right to a mining claim by adverse entry thereon.

At the time the public survey of public land is made it is the duty of the deputy surveyor under the law of 1796 to "note in his field book the true situation of all mines, salt springs and mill seats which come to his knowledge, all water courses over which the line he runs may pass, and, also, the quality of the lands." It is under the last provision that the report of the surveyor is made classifying the land as agricultural or mineral land, and which return is prima facie evidence that the land is of the character assigned to it by him. The examination upon which this conclusion is based is generally of the most superficial character and is often made by a person who is not qualified, theoretically or practically, to pass upon the mineral value of the ground; or, if otherwise, he does not in any event take the time to carefully examine it in order to truly determine its real character, even were it possible in all instances to state with any accuracy whether the land contained minerals or not. That fact is often only ascertained after expensive and careful exploration. There is no law nor instructions requiring the surveyor in his line of duty to go anywhere than along the borders or outlines he is surveying.

He merely passes over the confines of the section, with his attention more directly absorbed by the duties of his scientific profession and the necessity for absolute accuracy in his courses and distances. Even were he a geologist or mineralist his opportunities of observation along the course of his lines would be the scantiest, and beyond those lines, or on either side of them, his duties do not carry, but prohibit him from going. So that, practically, the interior of the section, or that portion thereof not immediately along the line being run, is beyond the observation or knowledge of the surveyor, and his opinion in relation to the same cannot be properly of much value. His return does not preclude proof of the facts as they really exist. If land is proven to the satisfaction of the land department to be more valuable for mineral before an agricultural claimant has acquired a vested interest therein it will not be patented to him as agricultural land.

As a rule, nearly all land is officially returned as agricultural land of the first, second or other lower grades and the surveyor's judgment in this respect is always adopted and approved, as, of course, by the United States Surveyor-General; it then becomes a part of the records of the land office and a menace to the mineral claimants of any part of such lands, because upon the latter is thrust the burden of proving the contrary. The value of the average surveyor's report in this particular may be demonstrated by saying that the land within which the famous Iron Mountain mine in Shasta county is situated, and which produces a profit of about $1,000,000 a year, was returned and patented as agricultural land, because the land office records showed it to be such, under the now practically extinct species of scrip known as "Agricultural College Scrip." A great part of the land embracing the Utica mine in Calaveras county was returned as and is patented as non-mineral land. Nearly all of Grass Valley mining district—which contained more mineral of value than any similar extent of territory in California—was returned as agricultural land. It is a notorious fact that many miles of the Mother Lode of California were so returned and are held under patents issued to agricultural claimants.

It is also well known that thousands of acres of land in the oil districts of this State are classed as agricultural land in the land department records, the entire surface of which is covered by shales and gypsum—the latter of commercial value both in quantity and quality. On the strength of the record of the land department, such lands have been selected by the "scrippers" as agricultural in character, although the same are covered with placer locations, and wholly unsuitable for cultivation.

It seems to be generally assumed that all land is agricultural until it is proven to be mineral, and the question being raised in the case of a contest between mineral and agricultural claimants the test is whether the land as a present fact is more valuable for mining than for agricultural purposes; conjectures, surmises or even probabilities not being indulged in in the miner's favor.

In other words, it is not sufficient in such a case to show that the land is of little agricultural value—that it presents indications of containing mineral in paying quantities—but from actual production that it is of value for the mineral it contains, and not from any theory that it may produce it. This is the rule laid down by the land department, and is possibly in the nature of legislation supplemental to the mining law by a quasi judicial tribunal in excess of its jurisdiction. This rule of the land department has been adopted by the courts. The mining Act of Congress expressly excludes all land valuable for minerals from the operation of laws governing the acquisition of agricultural lands. But no method is provided in the Act for determining what such lands are. There is no rule provided by statute to determine the extent or value of the deposit of mineral which will make a tract of land mineral; and the courts and the land department hold that land is not mineral although it may contain some measure of gold and silver when the contest is between the miner and the agriculturist.

There does not seem to be any good reason why the rule which is applicable to mining locations when the contest is wholly between mineral claimants should not prevail in all cases. That rule is: that a location is valid, as between mineral claimants, where a discovery of mineral is made which is not, perhaps, of commercial value in either quantity or quality, but which the discoverer is willing to spend his time, labor and money in developing. Yet, such a location would not stand the test in a contest between mineral and agricultural claimants under the existing rule of the land department.

The early miners of California, drawn here from all parts of the world by the rich superficial auriferous deposits of the placer mines of this State, and practically without precedent to guide them, framed a code of laws suited to their own peculiar needs. In time the working of surface claims gave way to the exploitation of quartz veins, and the different mode of mining and rights of ownership of such claims gave birth to an entirely different code of laws, which have become the American common law of mining; thus showing the adaptability of the early miners to meet conditions as they arose. Had the mining Acts of Congress been passed in the days of the California placer or surface mines, we could understand that the land department had construed them properly by its stringent requirements, as above stated, because the value of the land as mining ground could have been demonstrated, say, in a day and without expense. Oil mining more closely resembles lode than placer mining. To prove the value of a lode claim is now and always was a very different matter from proving the value of a placer claim. Lode claims require time, the expenditure of large sums of money, the prospecting of the ground at great depths below the surface, the possible loss of the vein, and other incidents, delays and disadvantages to which the placer miner was a stranger. Many largely productive quartz mines have been the result of the fortunate finding of a blind vein—that is, one not appearing on the surface. It is well known among miners that it is not always the richest mines of any class that show upon the top of the ground. The segment of the Comstock lode—the Bonanza mines—which produced the greatest wealth was not where "Old Virginia" and his associates discovered the deposit of silver ore that electrified the world. That deposit was upon the surface of the Ophir mine and some distance northwesterly of the Great Bonanza. The surface of the Bonanza mines and the croppings thereon gave but little, if any, indication of the enormous and valuable mineral deposit existing below and far to the east of the croppings of the Con. Virginia and California mines.

Congress, in the mining Act of May 10, 1872, first provided for the acquisition of tunnel rights, the Acts of 1866 and 1870 being silent upon that subject. That is, that law gave the miner the right to prospect for blind or hidden lodes where there were little or no indications upon the surface of their existence. It gave to the locator of a tunnel claim the great length of 3000 feet along the line of the tunnel and the further exclusive right to locate upon the surface any and all lodes he discovered in running the same, but without right to patent the tunnel site.

There does not seem to be any good reason why the petroleum miners of to-day should not be accorded a substantially similar right while engaged in drilling wells or the running of tunnels for the discovery of petroleum or other mineral oils; nor why the example of the pioneer miners of this State in providing new laws for changed conditions, as heretofore shown, should not be followed by Congress. The petroleum miners need appropriate legislation to protect them in the discovery of mines containing the fluid minerals as much as he who seeks to discover blind lodes. They are now placed on a par with the surface miner, although they must bore wells or run tunnels for the development of their claims, as land chiefly valuable for petroleum oil, or see them pass to agricultural claimants because of the absence of a proper provision in the mining law protecting them in their holdings while prosecuting such work.

The definition given by the United States Supreme Court that by the term "placer claim" is meant ground within defined boundaries which contains mineral in its earth, sand or gravel; ground that includes valuable deposits not in place, that is, not fixed in rock, but which are in a loose state, and may in most cases be collected by washing or amalgamation without milling, is plainly not applicable to a placer claim chiefly valuable for its petroleum or other mineral oils. Under the law of February 11, 1897, land chiefly valuable for petroleum or other mineral oils may be located as a placer mineral claim. That Act is remedial and curative in its nature and was intended to overcome the ruling of the land department that land containing petroleum did not fall within the contemplation of the mineral laws and could not be located and entered as a placer mine. That law declares that lands chiefly valuable for petroleum or other mineral oils were open to location under the placer mining law and also placed oil land claimants in the same position before the law as if they had made their locations on the date of the passage of that statute. But it appears the officers of the land department do not make any distinction between that class of claims and placer claims containing solid minerals. The rights of the oil miners are now determined by the same rules that govern a placer claim, located for building stone, though the one requires the drilling of exploratory holes perhaps hundreds of feet in depth or the running of a tunnel to a great length to demonstrate its value, while the other is merely quarried; or, the oil claim is put upon the same plane as a claim having a superficial auriferous deposit, the value of which can be proven with but little outlay of time and money. This is clearly unjust to the oil miner, being in utter disregard of the conditions which surround him.

(TO BE CONTINUED).

"Lawyers and Experts;" "Science and Law."

Lines read by Dr. R. W. Raymond in response to the toast, "Lawyers and Experts," at the banquet given to the A. I. M. E., San Francisco, Cal., September 27, 1899.

There was a man who had grown old
In digging prospect holes for gold.
Right often in his pilgrimage
He dreamed he had the long-sought ledge;
Yet every time, with spirit saddened,
He was obliged to own he "haddened,"
And every time he cried, "You bet
"I'll hustle on and find her yet!"

At last he struck it; staked a claim;
Laid out a townsite round the same;
Sunk, drifted, stoped and crushed away,
And showed the thing would surely pay.
Fondly he thought that nevermore
He would be luckless as before.
Alas, his troubles were not ore!

One dismal day his happy labor
Was interrupted by a neighbor,
Who coolly told him doubts had risen
Whether the ledge was "his" or "his'n,"
And challenged him, without excuse,
His legal "apex" to produce.
"Apex! What's that?" he cried in woe.
"I cannot tell you," said his foe,
But I presume the lawyers know.
And this much I can say is true:
Without it, all is up with you;
Nor is the apex all. You see,
You must have 'continuity,'
And side and end lines, suited quite
To fit your 'extralateral right';
And it is further understood
A tunnel in the neighborhood
Will make your title far from good.
Then, other lodes may make connection,
Taking the space of intersection,
Or even unite with yours, and so
Gobble whatever is below.
Sure, many such things may combine
To make your mine not yours, but mine.
If you don't buy me, fear the worst!"

That miner eloquently cursed,
And said, "I'll see you—elsewhere first!"

Thus was begun the famous case
That filled the journals of the place,
And thither called a mighty host
From all the wide Pacific coast—
A dozen lawyers on a side,
And eminent experts multiplied;
Maps of the biggest and the best,
And models till you couldn't rest;
Samples of rock and vein formation,
And assays showing "mineralization,"
And theories of that or this,
And revelations of "genesis,"
And summings-up of sound and fury
Poured out upon the judge and jury.
No matter now which party lost—
It took the mine to pay the cost;
And all the famous fight who saw
Beheld, with mingled pride and awe,
What science breeds when crossed with law.

Incandescent Light Filaments.

The standard electrical incandescent light for general use is of 16 candle power. Out of the 25,000,000 electric lights used every year in the world, this size numbers 90%. A carbon filament for that sized light measures $\frac{4}{1000}$ of an inch in diameter, 10 inches in length, and 200 of these put upon a scale weighed ten grains: with 7000 grains to the pound avoirdupois, it would take 140,000 of these filaments to make a pound; at the current market rate for these, $10 a thousand, their value would be $1400. A man can carry 150 pounds in a sack on his back, and, if his sack was filled with such bits of carbon, his load would be worth $210,000. Take but a single pound of these filaments and stretch them out in a continuous straight line, and they would cover a space of 133,333 feet, or about 21.3 miles. The world's product for the year would reach 3700 miles, and in a little more than six years, at the present rate, would reach completely around the globe.

But the value of the filament of this size is small when compared with that of some for the smallest of the lights made. Whether a filament be for large or small lights, it costs about the same sum to the market, but its candle power makes a great difference in its size and weight. The smallest of the incandescent lights used for regular purposes is of 3 candle power. For this the filament is of a plain U shape, and is $\frac{2}{1000}$ of an inch in diameter and $\frac{3}{8}$ of an inch long; there would be 1,000,000 of these to the pound, and these would be worth $10,000. But, again, the lamp makers manufacture many tiny lamps for surgical and dental uses. The smallest of these is called the pea lamp. Its tiny bulb is about $\frac{1}{4}$-inch in diameter, and physicians use it at the end of probes and similar instruments to illuminate the interior of the human body. Its carbon filament is but $\frac{2}{1000}$ of an inch in diameter and but $\frac{1}{8}$ of an inch long. This is but the 320th part of the volume of the 16 candle power filament, and it would take 44,800,000 of these to make a pound; their value would be $448,000.

Of course, the larger the filaments are the less they are worth by weight; but whether they are of a value of $1400 a pound or $448,000, it is interesting to consider that practically all of this value is the product of human labor and skill. The material out of which they are produced costs but a few cents.

In the early days of experimenting with the electric light the current was passed through a thin wire of platinum; at that time T. A. Edison had agents looking all over the world for new sources of supply of that rare metal. Then, as now, nearly all the platinum of the world came from California and two districts in the Ural mountains, in Siberia. Had the people remained dependent upon platinum for their lights they would have needed for each one a piece of wire $\frac{6}{1000}$ of an inch in diameter and 15 inches long, and this, at the present price of platinum—$18 an ounce—would cost 13 cents. The world's whole product of this metal in 1887 was but about 9500 pounds, and would have been inadequate for the present lamp supply. Even to-day, with a product of perhaps 13,000 pounds, there would be but a small margin left after making 20,000,000 lamps, and merely the cost of the filaments would be $2,000,000. It was at this juncture that Edison conceived the idea of using a carbon filament. He confided his idea to his chief assistant, Mr. Batchellor, and they began work one evening. It is one of Edison's peculiarities that, once started upon a piece of work, he does not stop for sleep and sometimes even food. The material from which he proposed to make his filament was a spool of cotton thread. All that night Edison and Batchellor worked and all the next day, and then again all the next night. At the end of thirty-six hours they had produced a perfect filament. Mr. Batchellor took it up and they marched with it toward the bench where a glass blower was at work. Just as they reached the bench the carbon broke. "Edison," cried Batchellor, "we wont sleep until we make one." Back they went to work, and late in the afternoon they completed a second carbon loop. Again they marched with it to the glass blower's bench and placed it there in safety, but just then a jeweller's screwdriver rolled over it and broke it. Batchellor was an even-tempered man, but that was too much.

"I'm damned!" he cried. "Job got too much reputation for patience on a small capital."

There was no giving up, however. Back to work the two men went. Experience had been a good teacher, and before night they had completed a third filament, got it safely mounted in a bulb, exhausted the air and set it glowing with the electric current.

For a while the filaments were made of pieces stamped out of visiting cards, and many after that were stamped from paper. Others were made from slivers of bamboo. Weston was the first, perhaps, to use vegetable parchment for the purpose, but that is what the General Electric Company use to-day. This is virtually the material of which artificial silk is made. Just the materials and process used no filament maker will tell, for this is one of the last of the trade secrets, and the only one about lamp making. A mixture of vegetable matter, rich in carbon, like paper stock or cotton, is taken and is digested with sulphuric acid or chlorides until it is a gummy mass about as thick as dough. This is forced through dies, just as vermicelli is made, and it comes out in endless strings. For 16 candle power filaments the die has an aperture $\frac{3}{1000}$ of an inch in diameter. The string of paste falls into a jar partly filled with a secret liquid, where it lies in coils. Then it is run out, washed, partly dried and coiled on cylinders to become entirely dry. Then it is cut into proper lengths, with allowance for shrinkage, and taken in bunches and wound on shapers to give it the form desired and set into form by being heated slightly. Now it is ready for carbonizing. This is done by packing the bunches in crucibles with sifted charcoal or other carboniferous substances, and, after sealing, by baking it in a hot fire for 1½ days. When it is taken out every thread is black and shiny and seems to have a perfect surface, but it is not ready for use. Now each filament is taken separately and clamped with each end in a live electric current and while it is immersed in a vapor of gasoline the current is passed through it. The effect is to deposit upon the white-hot filament a coating of lampblack, or carbonized gasoline, which gives it qualities not otherwise obtainable. In the early days of their manufacture only eight 16 candle power lamps could be lit by 1 H. P., but now fifteen are used. The filament is now ready to be mounted in the lamp.

Unlike those fragile filaments which Edison produced, the new ones are handled easily, and, although they break easily when bent sharply, they are so springy that they can be drawn straight out without danger and then allowed to fly back to shape.

With the development of the carbon filament has come a gradual change in all the processes of lamp making, until the price of 16 candle power lights has fallen gradually from $1.25 each to 18 cents; or less when taken by contract in large lots.

Formula for the Assay of Mercury.

TO THE EDITOR OF "CONCENTRATES:"—In your issue of March 24th you gave a formula for the assay of mercury which can be improved upon. Grateful for the help I have received from your page in the past, I give you herewith an easy method which I am using and which I hope will be useful to your readers:

Put one-half or one gramme, according to its supposed richness, of the finely powdered ore into a common Battersea "C" annealing cup and mix it in the cup with five grammes iron filings, which have been washed with gasoline and heated to redness to rid them of grease, and cover the charge with one gramme of the filings. Set the cup over an alcohol lamp and cover it with a piece of silver foil large enough to leave a small margin outside the edges of the cup. This foil must be first cleaned, heated carefully to redness over the alcohol flame, cooled and weighed. See that it is smooth and fits the cup all around. Place a small glass beaker half full of cold water upon the silver foil to keep it cool. Adjust the alcohol lamp so that its flame point plays upon the bottom of the cup and continue the heat for about fifteen minutes. Change the water in the beaker as it warms, or, better, put in some small pieces of ice. Allow the cup and cover to cool and weigh the silver, any added weight being quicksilver, which can be easily seen on the silver foil, even as little as 0.1%. After weighing, the silver can be ignited to drive off the mercury and used over and over again. This is the method of Eschka, improved and simplified by Chism.

Spokane, Wash., March 28th. C. M. F.

General John Bidwell of California.

The first, the most famous and the greatest of all the princely pioneers of pioneer California, General John Bidwell of Rancho Chico, died suddenly from heart failure on April 4th, and thus came to an end one of the most interesting and picturesque of American careers. He was a contemporary of Godey, Kit Carson, Fremont, Lassen, Sutter, Vallejo. His marvelous and accurate memory held within its grasp an infinite number of details of the past sixty years of Pacific coast development, and his few published documents are among the most precious materials for the historian.

It is interesting to remember that John Bidwell, whose relationship to California began with his remarkable journey across the continent in 1841 (a journey which justly ranks among the most fascinating chapters of pioneer adventure), was ever a hewer of paths, a builder of roads. Last summer he was road building in the Sierras, and when he was stricken down last week it was while he was working on a road. It is largely due to his efforts and his example that Chico is one of the most beautiful of tree-sheltered towns, and that Butte county has many of the best roads in California.

This stately and noble old pioneer, whose name is writ large in the history of California, was a man of the large, simple Homeric type, whose nature fitted

The Late Hon. John Bidwell of Chico, Cal.

well with the great valley-plain of the Sacramento, the snow peaks of the Sierras, the ancient oak forests of his superb estate. There he kept open house for a lifetime, and what a procession of famous men and women have enjoyed the hospitality of Rancho Chico these fifty years! Asa Gray, Sir Joseph Hooker, President Hayes, Gen. Grant and Ralph Waldo Emerson were there, and governors, senators, authors, musicians and artists too many to name in this brief note.

It is not easy to synopsize in a paragraph the salient points of so active a career. One can find it set forth in the newspapers and histories. He was born in Chautauqua county, New York, Aug. 5th, 1819. When he came to California in 1841 there were hardly 100 "foreigners" in the whole region, and this young man of 21 easily and immediately became a leader among them. He seems to have impressed every one, even then, with his honesty and efficiency. He obtained a Mexican grant for Rancho Chico in 1845 and mined great store of gold on Bidwell's Bar in 1848. He was a State Senator in the famous first session; he served in Congress; he was a candidate for Governor in 1875 and for President in 1892; he took a useful and sturdy part in public affairs, battling ceaselessly for better local government, higher education and public rights. He was a pioneer of pioneer miners, with a miner's great heart and lavish hospitality—a "California miner" of the old day.

His services to California have been great. Last Wednesday, the 11th, from Rancho Chico, the home of this large-hearted pioneer, this lover of forests and mountains, this friend of children and Indians and animals, was borne to the grave all that was mortal of this man who was famous among the famous men who laid the foundations of the commonwealth of California.

POVERTY would soon be an unknown quantity if men could dispose of their experience at cost.

Sampling of Copper Ores.

TO THE EDITOR:—Please answer in "Concentrates" as to the manner used by smelters of copper in sampling copper ore sent them in carload lots. Also, what is the best way to know that your ore is given a fair sample? Our ore, to the eye and by assay, has run very well, and so has our sorting; yet, the carload values gradually grow less by the sampling, until ore that ran at first over 40% has gone down below 30%.

We cannot state definitely the method adopted by the smelters for sampling copper ores in the case referred to. Some use an automatic sampler, whereby a certain portion of the ore as it passes through the sampler is diverted for the sample. This portion might be one-fifth or one-tenth, or any other portion desired, depending more or less upon the richness of the ore. Others sample by hand. In sampling ores of ordinary grade, when crushed to the proper size for sampling, a smelter using the hand method would spread the ore on the sampling floor, and then as the pile is shoveled over every fifth shovel is taken for the sample. This fifth is spread on the floor in a flat, circular pile and divided into four quarters by lines crossing each other at right angles. Two opposite quarters are taken for the sample. These two quarters are then put through a crusher, after which they are again quartered down and requartered, by which the bulk is further reduced; then crushed again, and finally twenty or thirty pounds is taken as the final sample, which is then passed through a pulverizer, pulverizing it to a fineness where it will go through a 50-mesh sieve. From this pulverized sample the assay samples are drawn, put in bottles and sealed. It is customary to seal not less than three samples—one being reserved by the smelter, the second given to the owner and a third reserved by the smelter in case an umpire assay is necessary to settle a difference between the smelter and the owner.

If the shipper has doubts as to his getting a correct return for his ore, the best thing he can do is to go in person or send a representative to the smelter, see his ore sampled and get a portion of the sample, which he can have assayed by some reliable assayer. If his assay and the smelters' do not agree, he can then call for an umpire assay, to be made by some assayer mutually agreed upon.

California Quicksilver Mines.

The New Idria, Ætna and Napa quicksilver mines issue annual reports for year ending Dec. 30, '99, as follows:

	New Idria.	Ætna.	Napa.
Sales of quicksilver	$153,898	$120,904	$194,224
Quicksilver on hand Jan. 1, '99, since sold	41,400	35,550	45,225
Totals	$195,298	$156,454	$239,449
Expenses	$ 97,256	$ 86,190	$146,100
Net earnings	101,135	69,057	91,117
Dividends	90,000	50,000	50,000
Surplus	11,135	19,057	1,117

The New Idria expended $13,760, the Ætna $2679 and the Napa $4378 for construction and repairs and charged same to expenses. The Napa company also charged $20,769 for development work to expenses and charged off $1355 for depreciation on buildings.

The New Idria produced in '99 4780 flasks of quicksilver, the Ætna 3450 flasks and the Napa 5850 flasks. Production in '98: New Idria 5000 flasks, Ætna 3450 flasks and Napa 7850 flasks.

General Manager Buckminster says of New Idria: The reduction works have been improved and the ore is being handled very economically with the best results. We have continued to do a large amount of development work, which has given good results, and shows up a good deal of ore in reserve. The work of developing the San Carlos claims at the north end of the property has been actively prosecuted, and we have a good showing of opening up a good mine.

Of the Ætna he says: Operations during 1899 have given good results. The Silver Bow ore body, which has hitherto yielded the bulk of our ore, has been largely worked out to the ninth level, leaving a comparatively small amount of ore in the upper levels; but we are now sinking below the ninth level, endeavoring to trace the ore body down.

THE present mining contest at Butte, Montana, where mining lawyers and mining experts are gathered, lends present interest to the happy hit made by Rossiter W. Raymond at the dinner given in San Francisco, last September, to the visiting members of the American Institute of Mining Engineers, when in response to the toast, "Lawyers and Experts," Dr. Raymond read the original lines now published for the first time on page 400.

Bullion Consolidated Mine, Grass Valley, Cal.

The Bullion Consolidated gold mine is located two and a half miles south of Grass Valley, Cal. For several years development work had been going on quietly at this mine with encouraging results. In June, '99, George Mainhart, who had previously conducted its affairs in connection with other properties of which he was superintendent, took active charge of the Bullion, and he has since inaugurated improvements of considerable extent. The most notable of these is the erection of a 10-stamp mill, shown in the foreground of the accompanying illustration. He has also sunk the shaft 112 feet, making its present depth 930 feet, and has run and extended drifts at different levels to the extent of 2000 feet. He is now driving south on the 900 level in order to strike and develop a shoot of known richness in the old Ione location, this being one of the four claims belonging to the company. The other claims, besides the Bullion, are the Galena and the Union Jack. It is expected that the Ione shoot will be reached in the near future.

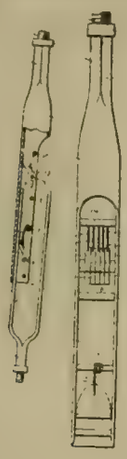
Bullion Mine and Hoist, Grass Valley, Cal.

The equipment at the Bullion is now as follows: A steam double-reel friction hoist and a Cornish pump are stationed in the hoisting works. The pump is run by electric power, but has steam attachments in reserve. An air pump for ventilation of the mine is attached to the Cornish pump. The mill was completed in August, '99, and is modern in every respect and so planned that it can be enlarged by an addition to the west when the same is needed. The 10-stamp battery and the four concentrators are run by electricity. The ore, which is now coming mainly from the 700 level, is 5% sulphurets. These are sold to local reduction works or to Selby's. The shaft contains three compartments, two for hoisting and one for the pump column. The strike of the vein is north and south, and it dips to the east at an inclination varying from 15° to 20°. The vein is from 2 to 4 feet wide, in granodiorite. The mine makes considerable water, but this is easily handled by the pump, which, at seven strokes, raises 350 gallons per minute.

The principal stockholders in the Bullion are business men of San Francisco and Sacramento. The superintendent, George Mainhart, has long been a resident of Grass Valley and has been identified with prominent mining enterprises. Under his management strong hopes are centered in the Bullion.

Grass Valley, March 18. H. G. P.

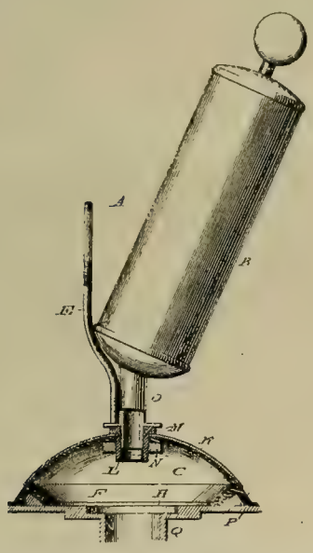
COLORADO MINING MEN are discussing the problem of obtaining mining timbers, as the supply of heavy mine timber for square sets and other underground work is comparatively limited. The land office has tightened the screws considerably of late, and it is believed that ultimately the advance in timbers will be more than the mines can stand. It is figured that in shaft sinking where 6 feet square sets are used the cost will be increased by $5 per foot. Congressman Lacy has introduced a bill framed in accordance with recommendations of the General Land Office, revising the existing statutes relating to the disposition of timber in the public land States. The measure authorizes free use of timber by miners, prospectors and bona fide settlers on their own claims and farms, and provides that the Secretary of the Interior may sell so much of the timber growing on the public lands as may be necessary for the use of persons dependent on timber in settling the country and developing and maintaining its resources.



MINERS are reaching Lake Superior copper and iron districts from the Transvaal. These men average exceptionally high, having been employed at wages averaging upwards of £1 per day in the gold mines of Johannesburg. The new comers from South Africa are nearly all British sympathizers and are not hopeful of an early settlement of trouble now agitating the Transvaal. The number of these miners reaching Michigan mining camps in the past few weeks exceeds 100.

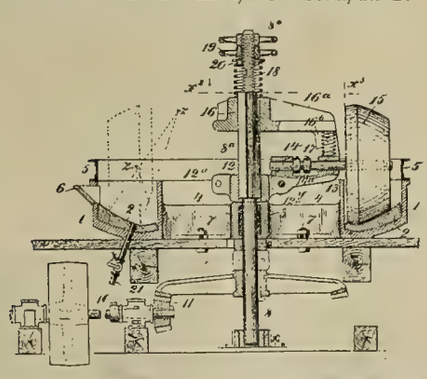
Mining and Metallurgical Patents.

Patents Issued April 4, 1900.



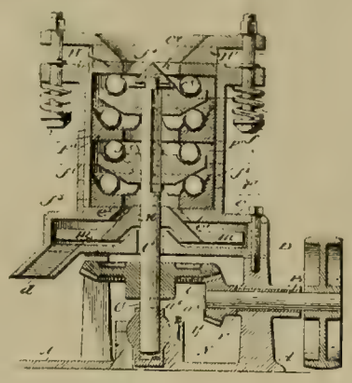
Spec'ally Reported for the MINING AND SCIENTIFIC PRESS.

OIL WELL TOOL.—No. 646,422; C. R. Fisk, Cecil, Pa.



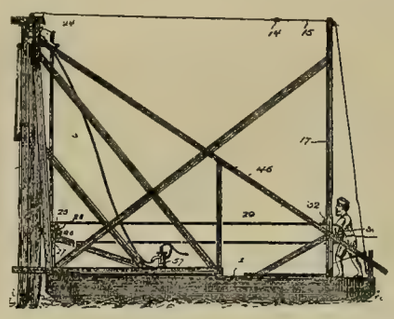
A tool for removing sucker rod straps from oil wells consisting of hollow tubular socket provided interiorly with series of upper and lower pins extending laterally therethrough, a pawl mounted upon center pin of lower series of pins, a spring mounted upon pin above pawl, the free end of which is adapted to bear against pawl, a series of pawls independently mounted upon center pin of upper series of pins, and a series of springs mounted upon pins above pawls, the free ends of which are adapted to bear against pawls.

LIFT AND FORCE PUMP.—No. 646,455; E. Noppel, Philadelphia, Pa.



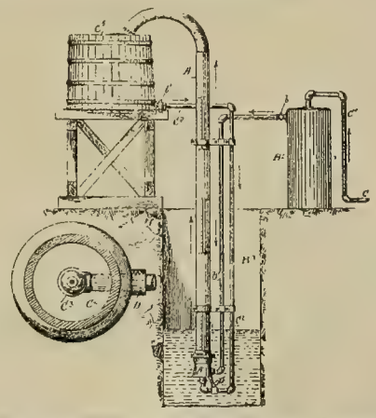
A combined force and suction pump, pumping device, cup provided with yielding bifurcated open end, a strengthening or stiffening cap over body portion of cup, outer edge of cup being situated at juncture of bifurcations of cup, the pumping device having a flanged and threaded nipple, a cup having an exteriorly and interiorly threaded headed sleeve within opening, and a nut upon sleeve, the cup being held between head of sleeve and nut, sleeve receiving nipple.

GRINDER FOR CRUSHED ORES, ETC.—No. 646,484; J. F. Wiswell and F. B. Smith, New York, N. Y.



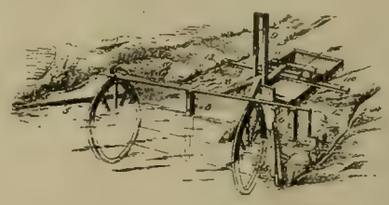
In an apparatus for the purpose specified, the combination with the trough or bed, upright driving shaft 8, and grinding rolls, of the boss 12 on the shaft 8, the bearing blocks 13 hinged thereto, the longitudinally slidable, radial roll shafts 14, mounted in the bearing blocks 13, the spider, having a boss 16, arms 16ª, and pairs of pendent cheeks 16ᵇ embracing the respective blocks 13, spider being slidable on but rotative with shaft 8, springs 17, between arms 16ª and respective bearing blocks, the spring 18, on the upper end of the shaft 8 and pressing on the boss 16, and nuts on the upper end of the shaft 8 for regulating the tension of the spring 18.

PULVERIZING MILL.—No. 646,507; T. J. Sturtevant, Newton, Mass.



In a pulverizing mill, the combination with tube or casing the interior of which affords a pulverizing chamber, of plurality of superposed alternating rotating and non-rotating races within chamber, each race being provided with circular series of pulverizing balls, each race supporting weight of balls and races above it, and discharging the crushed material on the race beneath it, a lower chamber beneath pulverizing chamber for receiving pulverized material and provided with a discharge opening, and rotating scrapers within lower chamber for conveying pulverized material to discharge opening.

DRILL GOLD DREDGE.—No. 646,532; S. Babare, Tacoma, Wash.



Combination with float, of a dredging cylinder mounted thereon, having series of projecting ribs on its lower portion, extending below ends of cylinder to form digging points, gearing for rotating cylinder, comprising spur gear upon upper end of cylinder, spur gear meshing therewith sliding upon a squared shaft, latter gear having peripheral projection adapted to engage peripheral groove upon cap piece of cylinder, whereby the two gears will be kept together when cylinder is raised or lowered, means for rotating squared shaft, and means for raising and lowering cylinder.

AIR LIFT PUMP.—No. 646,640; G. H. Evans, Oroville, Cal., assignor of one-half to the Risdon Iron and Locomotive Works, San Francisco, Cal.

In an air lift pump combination with discharge or column pipe having an inlet opening in its base, and a series of air jet openings above inlet opening, means for forcing air through the jet openings, a tank above the pump and into which the pipe discharges, and a hydraulic water supply pipe leading from the tank to the base of the column pipe having an upturned nozzle on its lower end arranged in line with the interior of the column pipe for the purpose specified.

HYDRAULIC DREDGE.—No. 646,769; S. C. Swarts, Rangely, Colo.

A hydraulic dredge, consisting of means for damming the stream, adapted to be moved forward in an upright position by the pressure of water against it; a floating guide for holding damming means in an upright position as it moves along the stream; dredging plows disposed in a plane below the bottom of damming means and secured thereto, plows being adapted to travel over bed of creek and hold lower end of damming means above bottom of creek, to provide for passage of water between plows and damming means to disintegrate dredged particles as damming means is carried forward by hydraulic pressure.

METHOD OF EXTRACTING GOLD AND SILVER FROM THEIR ORES.—No. 646,808; T. Cruse, Helena, Mont.

Improved process of recovering precious metals from their ores, which consists in reducing the ore to a pulp, adding cyanide of potassium, adding to the mass bluestone to precipitate the aurous and silver cyanides, then adding a reagent to precipitate the precious metals which may remain in solution after the precipitation of the aurous and silver cyanides, then decomposing the precipitated cyanides to free the precious metals, then extracting the precipitated metals.

PROCESS OF HARDENING STEEL.—No. 646,528; C. G. Meissner and R. Bennewitz, Magdeburg, Germany.

Process of hardening steel, consisting in cooling the heated metal in a bath composed of about three parts of water and one part of a mixture composed of zinc white, charcoal dust, leather liquor and petroleum.

The Telluride, Colorado, Folio.

The United States Geological Survey has just published folio 57 of the Geologic Atlas of the United States, relating to the Telluride quadrangle, in the San Juan mountains of southwestern Colorado. This folio differs from the earlier ones in that the descriptive text, 17½ pages, is practically a full report upon the geology of the quadrangle, not a condensation from such a report. The text is in two parts; the first, by Whitman Cross, relating to the general geology of the quadrangle; the second, by C. W. Purington, referring to the economic geology. The latter is an abstract from the detailed report in the Eighteenth Annual Report of the Survey, Part III. The folio contains, basides the descriptive text, a topographic map; a geologic map in strong colors; an economic map in lighter colors, showing the principal mines and ore veins, auriferous gravels, etc.; a structure-section sheet, representing the inferred relations of the formation below the surface; and three sheets of views from photographs, illustrating the physical features of the region which are described in the text. The Telluride folio is the first of a series to be issued representing the geology of the San Juan region; of these, the La Plata folio is in process of publication and will be issued during the present year. The price of the Telluride folio is 25 cents. Payment should accompany order, and should be made by postal or express money order or in cash (not stamps or check)—the exact amount. All communications relating to publications should be addressed to: The Director, United States Geological Survey, Washington, D. C.

SEVERAL bills introduced in Congress have been referred to Commissioner Herman of the General Land Office for his judgment as to their merits. One of these provides that exclusive leases for mining purposes may be granted to lands within the territory of the United States which lie below high water mark. It is proposed to grant exclusive leases upon condition that a bond of $5000 be given to insure proper fulfillment of the agreement. Commissioner Herman reports adversely on this bill for the reason that, while Cape Nome is not specifically mentioned in it, the evident intent is to make it apply there. It is held to be contrary to the policy of the United States Government to grant exclusive leases of this character to gold fields, and the proviso in regard to a $5000 bond would operate to exclude poor miners from securing grants.

Coolgardie, Aus., Water Pipe Line.

In the MINING AND SCIENTIFIC PRESS of March 12, 1898, appeared a technical article on a proposed Australian hydraulic enterprise, which, from its magnitude, was attracting universal attention, involving the construction and placing of 328 miles of 30-inch steel pipe, to daily deliver 5,000,000 gallons water, at an original cost of about $10,000,000.

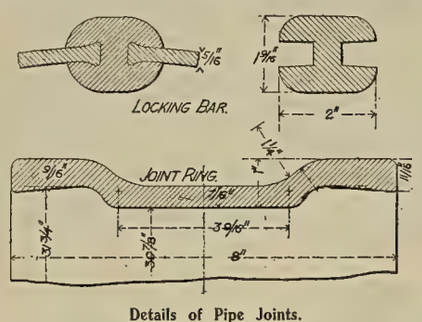
In continuation of the extended discussion of the project in the article referred to, it may be said that the committee appointed to investigate and report did so, and from the Engineering Record it is learned that, as a result of such investigation and report, the works are now under construction.

There are some changes and modifications in the original plan. The one thing that aroused the most surprise was the recommendation that the pipe be laid upon the surface of the ground. This plan the engineers in charge propose to carry out, expecting by the special construction of the pipe to overcome the manifest difficulty because of strain, etc., occasioned by a climate where the temperatures are so extreme.

With a change of temperature of 75° Fahr., the amount of expansion to be provided for is about $\frac{3}{8}$-inch for every 100 feet length of pipe. But this amount was thought likely to occur only if the pipes are emptied during extremes of temperature. Special joints to allow for expansion and contraction were recommended.

In a pipe line of such extreme length the question of leakage is important. Small leaks from the joints and rivets of steel pipes, subject to strains caused by contraction and expansion, are certain to occur. If detected early, they are not difficult to repair; but below ground it was thought that individual cases would be difficult to detect. It was because of this that the engineers recommended that the pipe line be laid on the surface of the ground, thus furnishing greater facility for the inspection of the pipes and the suppression of leakage. Other reasons favoring this decision were the decreased cost and the fact that the soil along a large part of the line contains much salt. There is no prolonged frost to trouble the pipes and no difficulty is apprehended in protecting them from wanton injury.

The method of fixing the main on the surface of the ground was considered by the commission of engineers. They recommended that the pipes be supported on timber bolsters, or sleepers, the upper sides of which would be hollowed to a depth of not less than 6 inches to fit the under side of the pipe. So placed, with expansion joints every 120 feet, the pipes would offer but little resistance to motion and creeping might occur unless prevented. Also, in all curves the joints would have a tendency to move radially from the center of the curve. With a 30-inch pipe under a head of 400 feet and laid on a curve having a radius of 660 feet, the radial thrust on each length between the expansion joints is given at about nine tons. In the event of the sudden closing of a valve this pressure might be much higher. It is essential that both the tendency to creep and to move at the curves should be effectually counteracted. To prevent such movements the commission recommended flanges on the under side of the pipe to bear against piles or a mass of concrete, and piles or concrete blocks on the outer side of the pipe on curves.



The engineers recommended that the pipe line should be made up of riveted steel pipe 31 inches in diameter, made of plates $\frac{3}{16}$-inch to $\frac{5}{16}$-inch thick, and of lap-welded pipes from 26 to 29 inches in diameter. The friction head in such a pipe line is about 1300 feet, making the total head, against which the water will have to be pumped, about 2600 feet.

Bids were received for 246 miles of 30-inch riveted pipe and 82 miles of 26 to 29-inch welded pipe in London and Perth. The former were higher than the estimated cost, the latter were lower. The latter, however, substituted for the welded pipe a type of pipe having a patent locking bar joint, the design of M. Ferguson of Perth. This pipe is made of steel plates fastened together with two longitudinal joints made by swelling the longitudinal edges of the plates and bringing them together in grooves made in the opposite sides of a bar. The bar is then closed onto the swollen edges of the plate by pressure.

A pipe of this kind had been previously tested by W. C. Unwin. Strips with the joint in the middle of each were cut from the pipe and tested. In five out of six tests the strips broke through the solid plate and not at the joint, while the remaining strip broke at the joint. A piece of pipe 4 feet long, 12 inches in diameter and $\frac{1}{2}$ inch thick, having two of these patent joints, was also tested by hydraulic pressure. An internal water pressure of 800 pounds per square inch was applied before the test was stopped by leakage at the ends, which had nothing to do with the construction of the pipe. Subsequently a pressure of about 850 pounds per square inch was put on before leakage again stopped the test. In a third test the pressure momentarily reached 900 pounds per square inch. The pipe was bulged, but there was no leakage at the longitudinal joints and they did not appear to be injured.

There were two bids received at Perth, one by Messrs. G. & C. Hoskins for the riveted pipe, the other by M. Ferguson for his patent locking bar pipe in place of the welded pipe. In view of the fact that the total of these two bids was considerably below the estimated cost, it was thought desirable by the chief engineer to have all the pipes 30 inches in diameter instead of some 26, 27½ and 29 inches, as specified. It was also thought desirable to have the two bidders unite and supply the whole of the pipe of the locking bar type. They were also requested to furnish a bid providing all the pipe, excepting 1000 lengths, which were to be of plates $\frac{5}{16}$ thick, of plates ¼ inch instead of a portion of plates $\frac{3}{16}$ inch thick. It was estimated that the adoption of this type of pipe and the increased size would, by decreasing the friction, reduce the cost of pumping by about $50,000 per year. The total revised bid was about $5,000,000 and was still about $350,000 under the original estimate. This figure was merely for furnishing the pipe without joints or valves, and did not include any price for laying. The contract was awarded half to G. & C. Hoskins and half to M. Ferguson, and called for pipes of the locking bar type. A contract for one-half the required number of joint rings was also awarded to each bidder.

The pipes are to be furnished in lengths of 28 feet, each length to be composed of not more than two plates and two longitudinal locking bars. The specifications require that the locking bars for the pipes made of ¼-inch pipe shall weigh not less than 6½ pounds, and those for the pipes made of $\frac{5}{16}$-inch plate not less than 7¾ pounds per linear foot, unless it is proved that such weights can be reduced without any risk of impairing the efficiency of the joint. The lengths of pipe are to be jointed together by means of the welded steel rings shown in the illustration.

Details of Pipe Joints.

When considered desirable by the engineer anchor plates consisting of three 12-inches pieces of 6x4x⅜-inch angle iron shall be double riveted to the pipe, 3 feet from one end of every fourth length.

The specifications require that the plates and bars shall be made of open-hearth acid steel, and the plates shall be capable of withstanding a tensile strain of not less than 25 nor more than 29 tons per square inch, with an elongation in 10 inches of not less than 20% and a contraction of area of not less than 45%. The steel must also resist the following drifting test: A hole ⅝ inch in diameter to be punched within 1¼ inches of any edge of a plate and to be drifted out, cold, to a diameter of 1⅝ inches without showing signs of fracture. Not less than two tensile tests will be made from each cast, and bending and drifting tests will be made from each plate. The pieces must bend cold around a bar of a diameter three times the thickness of the plate, without signs of fracture. The locking bar joints are to be fully as strong as the plates.

Before the longitudinal joints are made, the locking bars and the edges of the plates are completely freed from black oxide by being dipped in a bath of dilute sulphuric acid and then in a bath of lime water, followed by scrubbing, if necessary. This is done under cover and the plates and bars are not exposed to the weather after dipping, but are at once formed into pipes. The pipes are then submitted to hydraulic pressure of 400 pounds per square inch and also to smart tapping with a hammer while under pressure. After they have been tested and approved by the engineer they are dipped in the baths of dilute sulphuric acid and lime water, and when thoroughly clean are coated with a composition of asphalt and creosote. The pipes are heated uniformly to about 300° Fahr. and are dipped into the composition, which is kept fluid at a uniform temperature. They are left in the bath long enough to acquire its temperature, and after removal are suspended until the excess of coating has drained from them.

The commission of engineers recommended various valves for different points on the line. Stop valves are to be used at the inlet to each reservoir, at the outlets of the pumps, at every important depression, and generally at points not exceeding five miles apart. Scour valves, having openings 6 to 9 inches in diameter, are to be placed on pipes connected with the under side of the main at every depression. Back-pressure valves are to be provided at the inlet to each reservoir and immediately above each pumping station. There are to be air valves at all summits on the line to liberate air when charging the main and to keep it free from air disengaged from the water flowing into it. These are to work automatically and will be placed in groups of three and four in one casing and have a considerable discharging capacity. They are to be protected by a strong cover from the possibility of interference or injury. They will also admit air to the main in case the pressure in it falls below that of the atmosphere. To prevent the air from being carried past these valves by the flow of the water, the commission recommended the provision of air domes consisting of 12-inch cast-iron pipes, 18 inches in depth, with flanges fitted to the crown of the main. Immediately above each dome should be fixed a 3-inch stop valve, and above that the air valve proper. Instead of cutting a 12-inch hole in the main, it should be perforated with numerous smaller holes. In addition to this, at the most important summits, about sixteen in number, the commission recommended enlargement of the main to about twice the normal diameter, thus forming chambers in which the velocity of the water would be reduced, and where the air or gas could freely disengage itself from the water and escape by the air valves.

There are to be eight pumping stations; one at the Greenmount reservoir, the second is a short distance from it, the others at various points along the line. On most sections of the line, it happens that there is high ground at a short distance, compared with the length of the section, from the pumping station. Up to this high ground the pumping main from each station will always be under the pressure due to the altitude and the friction. From this elevated point, however, the flow to the next pumping station will be by gravity. This portion of the pipe line will ordinarily be under the pressure due only to the elevation and the hydraulic gradient.

There is one section requiring special treatment. If the section between the second and third pumping stations were treated similarly to the rest, the closing of the stop valve at the third station would place about thirty-six miles of the main under a head of 450 to 650 feet. In order to reduce this head about 200 feet, a reservoir is to be built on high ground near the thirty-third mile of the line. This is to have a depth not less than 25 feet and a capacity not less than 6,000,000 gallons. The pipe line is to be broken at each pumping station by the insertion of a reservoir having a depth of at least 20 feet and a capacity not less than 2,400,000 gallons, into which the water will flow and from which it will be pumped into the next section of the line.

The location of the eight pumping stations along the line, as recommended by the commission of engineers, is such that the head, against which the water will be pumped, will be the same at each of the first four and also at each of the second four. By this arrangement there will be a great uniformity of the pumping machinery, there being but two sizes of steam engines proportioned to the two different lifts. This uniformity was considered desirable. As to the type of pumping machinery, triple-expansion engines with surface condensers were recommended. Both direct-acting engines without flywheels and engines with flywheels were considered suitable for pumping into the long pipe line. It was thought desirable, under the conditions in Western Australia, to sacrifice a little in economy of coal consumption, if by so doing a considerable gain in the simplicity of the engines could be obtained. Many questions regarding the pumping machinery were left to the manufacturers who might present bids for the same. Each station is to have a reserve for use in case of accident.

At present the excavation for the foundation of the dam on the Helena river, amounting to 50,000 or 60,000 cubic yards has been completed. The delivery of the pipe under contract has begun. Bids for supplying the pumping machinery to the extent of about 6000 H. P., which is about double the amount required for daily work, have been received. This work is being carried out under the direction of the Public Works Department of Western Australia. The total cost of the project is estimated to be about $12,000,000.

At Coolgardie there is to be a service reservoir having a capacity of at least 24,000,000 gallons. In the future it may be necessary to construct another reservoir about four and a half miles from this one and 170 feet higher. An additional pumping station will be required for this, but both this reservoir and pumping station have been left for the future and are not included in the present project. A number of smaller service reservoirs at points along the line were included in the project, as were also 100 miles of 12-inch distributing mains at Coolgardie.

The difference in level between the Greenmount reservoir and the service reservoir at Coolgardie will be about 1300 feet, and it was assumed by the commission of engineers that the whole of the water would be pumped to this height.

AT Leadville, Colo., last week, the jury in the case of Theodore Craig, charged with larceny, brought in a verdict of guilty. Craig was a shift boss at the Ibex mine and the evidence produced showed that he had been systematically stealing valuable ore from the company's ground. One sack of the ore weighing seventy pounds was found in his cabin, and other ore which he had taken was melted down, producing gold to the amount of $110. In addition, $300 worth of gold ore was found in his possession.

MINING SUMMARY.

ARIZONA.

GILA COUNTY.

The Silver Belt says there is a better feeling apparent in Globe on account of the arrival of coke for the Old Dominion company, and the prospect of the early resumption of smelting.

COCHISE COUNTY.

At the copper property of Dos Cabezas Con. M. Co. the Foreman tunnel is in 175 feet. In the Roberts tunnel the ore chamber is 50 feet wide. A site for a smelter has been selected. The new town will be called Laub City.

SANTA CRUZ COUNTY.

(Special Correspondence).—The mill at the Tres Amigos mine has been shut down for a week on account of breaking the cam shaft, but that is replaced and operations resumed. The cyanide plant is now running in good order. The mine is looking well. The drift on the 130-foot level is 600 feet long with crosscuts every 100 feet, cutting the ledge 20 feet over all in ore. Assays taken the full width of the drift go $190 per ton.

Tres Amigos, April 5.

CALIFORNIA.

AMADOR COUNTY.

Record: J. Ross, Jr., and T. E. Thompson have sold the Hayden Ranch mine to a German company. It adjoins the Baliol mine on the north.——At the Lincoln mine crosscutting continues at the 1200-foot level.——A. McWayne has made arrangements to sink the shaft of the Pocahontas mine 400 feet deeper.

CALAVERAS COUNTY.

F. J. Solinsky is president Ford M. Co. They propose putting in an electric pumping plant, sinking the shaft 1000 feet and drifting southwardly, the cost not to exceed $30,000.

The Thorpe mine is not to reopen under the management of an English company, as previously reported.

EL DORADO COUNTY.

E. W. Claresse has charge of operations at the Montezuma mine at Nashville, where machinery for sinking has been placed.

FRESNO COUNTY.

The Yellow King M. Co. has incorporated at Fresno; capital stock, $25,000, subscribed in full. Directors—C. S. Cox, L. L. Cory, T. G. Hart, M. Webster, W. H. McKensie.

KERN COUNTY.

At Randsburg the pumping plant and pipe line from the wells at Goler to the Yellow Aster mill cost $55,000. A contract for doubling the capacity of the mill, making it sixty stamps, is expected. The new reservoir at the mill is 100 feet long, 20 feet wide, built of solid masonry and will hold 100,000 gallons.

MARIPOSA COUNTY.

(Special Correspondence).—The Columbus M. Co., near here, has bought a 20-stamp mill. It will be run by water power.

Coulterville, April 10.

NEVADA COUNTY.

(Special Correspondence).—Washington is on the South Yuba river, nineteen miles northeast of Nevada City. Its inaccessibility militates against its enterprises, it being remote from railroad facilities and cursed with bad wagon roads. Besides various prospects, the only properties which are being developed or worked at the present time are the Gaston Ridge, Eagle Bird, Gray Eagle, Champion, German and El Capitan.

The Gaston Ridge was formerly known as the California. It is four miles north of Washington. Work at the mine is being actively prosecuted. A crosscut tunnel 2300 feet in length has been run into the hillside, tapping a ledge of metamorphic slate varying in thickness from 4 to 20 feet. A winze extends 100 feet below this station. Although there are rich streaks of ore in the ledge, it is not a high grade proposition when worked as at present, the entire ledge being put through the mill. The ground breaks into large chunks, and before being sent to the mill it is run through a primary rock breaker, with jaws set wide apart; thence it is hoisted to the top of the mill and there goes through another rock breaker of the ordinary type and is reduced by 1100-pound stamps dropping ninety-six times per minute. There are twenty stamps in the mill. The ore is hauled from the mine by mule power in trainloads of seven to ten cars. These cars are side-dumping. In the mill a dumping device invented by Supt. Harmon is used. At the waste pile the dumping chair invented by Wm. Hogan of Washington—fully described in the MINING AND SCIENTIFIC PEESS of March 24th—is employed. The side-dumping car is used on account of the coarseness of the ore, and the dumping devices are resorted to in order to effect saving in time and muscular energy. From fifty-five to sixty tons of ore per day are crushed. Water is the motive power employed, it being taken from the North Bloomfield Co.'s ditch and delivered to the Pelton wheels under a fall of 400 to 460 feet. Two Rand air compressors, with automatic valves, are direct connected to a 15-foot water wheel. The rock breaker and the mill have each a separate water wheel. The concentrators and blower are run by water which flows from the mine. This is a large stream—fully 50 miners' inches. The machine shop and the stock of bar, round and flat iron are unusually complete, the remoteness of the mine from repair shops making these equipments a matter of wise precaution. About forty-five men are employed. Dana C. Harmon is superintendent, H. L. Johnson foreman.

At the Eagle Bird mine at Maybert, seven miles above Washington, the 800-foot shaft follows close to the ledge, at an inclination of 80°, with stations at every 100 feet. There are 1600 feet in drifts. The vein formation lies between granite walls. At places it is 40 to 50 feet wide, in which cases it consists of slate and schist intermingled. Where the ledge narrows down to 5 or 6 feet it is all quartz, though there are places where the solid quartz formation is 25 feet thick. The ore is not high grade, but under present management the mine is run at a profit to the stockholders. The company brings water three-fourths of a mile through its own ditch along the bank of the Yuba river, securing a fall of 180 feet at the works. The double-reel hoist, the air compressor and the 30-stamp mill are all run by this power. The ore is so lightly sulphuretted that no concentrators are used, the two that were in the mill having been discarded. The ore is crushed fine enough to go through a 30-mesh wire screen. About fifty-five tons per day are reduced. At present a day shift only is given employment, consisting of fifteen men. W. M. Wilson is superintendent.

The Gray Eagle mine is being developed by J. G. Cohoe, who has a bond on the property. An air compressor, run by water under 500 feet fall, is the present extent of machinery employed. A tramway had to be built before the heavy parts could be elevated to the mine.

The Champion Consolidated, near the Gray Eagle, is a promising claim and has been considerably developed by tunnels. Tunnel No. 2, where work is now being vigorously prosecuted, was driven 250 feet to the ledge, and drifts thereon are now being run. The ledge is from 1 to 3 feet in thickness. Work is also being done on tunnel No. 3. The ore is free milling and of fair grade. It is in contemplation to erect a mill. J. B. Tully is the foreman.

At the German mine, three and one-half miles east of Washington, little is being done. It is in contemplation to resume operations. There are two tunnels on the property, the lower being nearly 800 feet in length. There are ore chutes building from the mouths of the tunnels to a 10-stamp water power mill. The vein averages 5 feet or more. It is a free milling proposition, there being no concentrators in the mill. Many of the stockholders in the German are also interested in the Gaston Ridge mine, previously described. They have declined to sell the German, but prefer to work their property. M. D. Cooley has charge of the mine.

E. T. Worthley of Washington is developing the El Capitan. Like the Giant King and some other claims in the vicinity, there is here a large ledge of mineralized quartz—from 30 to 100 feet wide. It is, of course, low grade, and the question to be solved is whether it carries ore shoots of sufficient richness to warrant reduction. Mr. Worthley has driven a crosscut tunnel 365 feet into the hill and within another 100 feet he hopes to strike the ledge, upon which he will drift to find an ore shoot which crops out at the surface.

A few of the hydraulic gravel mines located on "The Ridge" in Nevada county, which were several years ago restrained in their operations by injunctions from the courts, are now able to resume work in a modest way after constructing restraining dams to hold back their debris. The most extensive of these is the Bull Run gravel mine at Relief Hill, operated under permit by Penrose & Harker. They have constructed a dam near the South Yuba river, a mile or more below their works. By an ingenious arrangement the tailings are run through grizzlies, by which stones or boulders from the size of a hen's egg up are rejected and automatically dumped into an adjoining ravine, not being carried to the restraining barrier. At the mine water under 200 feet pressure is projected against a bank 80 feet high, in which there is gold from the grass roots to bedrock, the heavier gold being contained in a stratum of blue gravel at the bottom of the deposit. The mine is expected to pay very well this season. About twenty men are employed.

The Union gravel mine, a drift proposition, is giving employment to fifteen men at Relief Hill. A tunnel 3700 to 3800 feet in length has been run into the gravel deposit of the old Eureka hydraulic claim. The ground is breasted out to a depth of 6 to 9 feet next to the bedrock, and without being crushed the gravel is dumped into sluices and the gold caught in riffles. Ordinarily fifty to sixty carloads per day are mined, though the swelling ground makes operations difficult and dangerous. At present considerable prospect work is being done. Chris Jepsen, J. P. Jepsen, C. Jorgensen and others of Relief Hill are identified with the work.

The Waukesha gravel mine (drift) of Relief Hill has a tunnel 2000 feet in length. At the face of this there is an incline of 200 feet, and then another drift 200 feet feet long to tap the gravel deposit. A hoist run by water is stationed at the top of the incline, and from these the ore is hauled into daylight by mule power. The gravel (100 cars per day) is washed twice, without being crushed, and pays about 80 cents per car. Fourteen men are employed, of whom John R. Jones, John P. Jones, Jas. Cameron, Wm. Myers and W. O. Williams are interested partners.

The Blue Lead gravel mine (drift), also at Relief Hill, is being slowly developed by the workmen, engaged upon contingent wages. They are earning $2.50 per day, but are entitled to $3 per day if they can make it out of the mine. Many think the main channel under the ridge runs through Blue Lead ground, and the prospect work is expected to reveal its location. A. Roach, postmaster at Relief Hill, is one of the principal stockholders in this property. Other local people are interested.

Nothing is being done in the North Bloomfield gravel mine, the courts having enjoined operations even after the elevator process was designed and put into execution under heavy expense. At the Malakoff, ten men are prospecting for the development of a profitable drift mine.

The Eureka Lake & Yuba Canal Co., Consolidated, have a permit from the Debris Commission to construct a dam, and this will enable them to work their gravel deposit near North Columbia (Columbia Hill) by the hydraulic process. It is expected the dams will be completed by June 1st. They will employ twelve men. Water will be projected against the bank under a head of 200 feet.

The Badger Hill M. Co. are running monitors at Badger Hill, near the old town of Cherokee, under permit from the Debris Commissioners. They have laid a new pipe line 4500 feet in length, and have thus secured a head of 250 feet. They have good ground, left after extensive operations were discontinued here twenty years ago. J. P. Myers is superintendent of the work.

The Reddik drift gravel mine is on the ridge two miles north of Nevada City. After sinking an incline shaft 550 feet deep, and running proper drifts, the company had begun one year ago to extract paying gravel. At this point their operations were blocked by an uncontrollable flow of water. It was found necessary to alter their pumping arrangements. By lowering the Cornish pump and pumping water into the drain tunnel, 90 feet from the surface, they were able to control the flood. They have now begun again the taking out of good gravel, raising from 160 to 200 carloads per day. This is run through a 10-stamp mill, provided with ordinary plates, and is then conducted into sluices. It is paying well. The machinery is all run by water, but there is a steam plant in reserve. About thirty men are employed under the superintendence of Wm. Graham, with J. T. Lindsey as business manager. Messrs. Fletcher, Kidder and Brown, of the Narrow Gauge Railroad, are principal stockholders.

Geo. W. Downey of Nevada City is considering working by the cyanide process 7000 tons of tailings left by the old Maltman-Crosby chlorination works at Gold Flat. He has a bond on the tailings and is sampling them.

Nevada City, March 25. H. G. P.

In the suit of Yuba county vs. the Kate Hayes M. Co., operating the Kate Hayes hydraulic mine, near Sweetland, an injunction asked by the plaintiff was made permanent in the Superior Court at Marysville this week. The attorney for the defendant made no opposition to the granting of the injunction.

PLACER COUNTY.

Near Lincoln the W. D. Spike mine, an old mine with a new name, is to have a mill, hoist, cable railway and automatic cars. The lead is cemented, showing a heavy wash. The gravel is thrown upon a grizzly. The finer portions fall through a screen, the coarser falling in a rock crusher, and so on down through a succession of screens until both kinds reach the rollers and are reduced to pulp. Tests show that the gravel averages $5 a ton; 125 tons a day is the estimated capacity of the plant. The mill will be run by an engine fed by crude oil, but electricity is to be the motor power. The cap of hardpan obviates timbering. The channel at present is 5 to 6 feet deep and pitching.

SAN BERNARDINO COUNTY.

Seventy miles south of Needles, C. H. Gray is developing the Arica, a free-gold proposition. The mine is in a ledge with a 2-foot pay streak of $100 rock. Three stamps pound out enough gold to maintain a developing force of twenty men.

SANTA CLARA COUNTY.

Bradford Quicksilver M. Co. has incorporated at San Jose; directors, H. R. Bradford, S. T. Kennedy, R. F. Kennedy, H. Fessler, J. Treadwell; capital stock, $500,000; subscribed, $336,500.

SHASTA COUNTY.

(Special Correspondence).—The Evening Star mine, in Old Diggings district, continues ore shipments of good grade. The owners will run a new tunnel below present operations 1000 feet long. The average grade of ore shipped from this mine runs $40.

The Minnesota mine is making regular shipments. On this property, long abandoned, extensive development goes along with reopening the old work.

A shipment of high grade ore was made last week from the Spotted Horse mine at French Gulch.

At the Black Spider mine a horizontal engine and blower are being placed. The shaft is 110 feet deep. A station has been cut and drifts are being run on the ledge, both north and south, and sinking the shaft continues simultaneously.

The Bennington mine, also among the abandoned properties until recently, made a four-carload shipment last week, one of which was high grade. When I speak of high grade ores I mean a value of from $200 to $400 a ton. The Bennington is also furnishing forty tons of quartz a day to the Keswick smelter.

Lawry & Holman have put ten men to work to take out from forty to fifty tons of quartz per day for fluxing, to be shipped to the smelter at Keswick.

At the Bully Hill mines, Captain De Lamar's property, preliminary work is in progress on roasting stalls, smelter building and tramway. About twenty-five men are at work in the mine, and as many more on the surface work above referred to. A new townsite is being surveyed adjoining the smelter site, to be known as Sallee. So soon as accommodations can be provided, it is assumed that the labor force will be largely augmented, but it is premature for men to come here expecting employment.

Redding, April 10.

TUOLUMNE COUNTY.

(Special Correspondence).—C. S. Long, Pres. Tri-Color M. Co., is back from San Francisco, where he arranged for a compressor and hoist capable of power to sink 1800 feet if necessary. If present crosscut developments warrant, the 20-stamp mill will be doubled this summer.

Tuttletown, April 12.

The Densmore mine, near Columbia, recently reported sold to Hayward & Lane, has not been sold, and is not for sale at present.

The Santa Ysabel G. M. Co. will meet at Cheyenne, Wyo., on April 30th, to carry out the plans of the management and the committee of stockholders to assess the stock $1 per share under a reorganization.

El Tarantula M. Co. has incorporated at Stent; J. H. Dull, C. C. Mathews, H. C. Dorrah, H. M. Pease, W. M. Webster; capital stock, $500,000; subscribed, $50.

COLORADO.

CHAFFEE COUNTY.

At Granite, the Cache creek placer property has begun work earlier than heretofore, and, if the water supply holds out, the company expects to clear up $100,000 this season. When the new ditch from above Twin lakes is completed, the company will have water enough to run four giants continually.

CLEAR CREEK COUNTY.

(Special Correspondence). — The Main Trunk shaft has been retimbered and sinking from the present 600-foot level is to be resumed. An air compressor is to be put in to facilitate the work. A connection will be made with the Newhouse tunnel.

The Newton mill treats 100 tons of ore per day and has 2000 tons on hand.

Idaho Springs, April 8.

At Idaho Springs the Stanley mine has been bought by T. J. Chisholm for Montreal men. The first payment of $200,000 has been made, the remainder of the $1,500,000 to be paid within six months. Work on a 100-ton concentrator began. C. A. Gehrmann is Mgr., J. Bowden

Supt. There are thirty-five patented claims in the group, covering 100 acres. Water rights are owned for one mile along Clear creek. This power is used in running a small mill, eleven air drills in the mine and two pumps. The air compressors have a capacity for operating forty drills in addition to the pumps. The ore reserve is said to be unusually extensive.

EL PASO COUNTY.

Contracts involving $500,000 have been let by the Standard M. & S. Co., for a reduction plant at Colorado City within the next six or seven months, capacity of 400 tons per day, to be in operation December 15, 1900.

FREMONT COUNTY.

At Bare Hills a new mill is just finished for the Mount Pisgah M. & M. Co. by Mgr. Coolbaugh, five stamps of 850 pounds each. The water is forced by a 6 H. P. gasoline engine 3000 feet to an elevation of 135 feet.

LAKE COUNTY.

(Special Correspondence).—An important strike was made in the Revenue shaft on Rock hill on the 5th inst. At 535 feet depth a blue lime contact was encountered, containing a body of ore running three ounces silver to the ton. This is considered proof of the contention that the ore zone of the down-town section of Leadville district extends far to the southwest under Rock hill, which has been only slightly explored. The Revenue is under the management of R. B. and N. M. Estey. The discovery they have made will surely induce others who own ground on this hill to explore and develop.

Leadville, April 7.

JEFFERSON COUNTY.

(Special Correspondence).—Reports are current that telluride ores have been discovered in Turkey Creek canyon.

Golden, April 9.

MINERAL COUNTY.

(Special Correspondence).—Progress of the work in the Nelson tunnel is being retarded by the deluge of water encountered.

Shipments from the Creede district run about 2700 tons per week.

The Silver Fleece mine has been unwatered by a pump that handles 12,000 gallons per hour. The mine will now be further developed and is expected soon to become a shipper.

Creede, April 8.

TELLER COUNTY.

(Special Correspondence).—The Brodie cyanide mill, below Anaconda, recently started up, after a long period of inactivity, under lease and bond to the Centennial Gold Extraction Co., of which F. J. Arkins, E. C. Limbach, E. P. Welch and C. T. Arkins are officers. The equipment has been improved and the power changed from steam to electric. The mill is treating ore at the rate of about 1500 tons per month.

Anaconda, April 3.

(Special Correspondence).—The Mary McKinney, which last year shipped about 100 tons of ore per day regularly, divided between mills and smelters, is now reduced to about thirty tons per day of its highest grade to the smelters. It is claimed the low and medium grade is being held pending the controversy over treatment charges and freight rates.

The Elkton mine tonnage is now running about 1500 tons a month, which is all practically above one and one-half-ounce ore. Last year this mine shipped a considerable tonnage as low as three-quarter ounce in value. The contention is that they cannot afford to mine the low-grade ore at present treatment rates. The Elkton has sunk the main shaft to the 800 level, where a straight-lift pump of 1000 gallons per minute capacity has been installed. The ore body opened at the 800 level is the same as that worked at higher levels, but is of larger dimensions and about the same grade. At the surface a new first-motion, double-reel hoist will be installed. This will enable the work to go on more rapidly.

The Doctor mine is shipping about fifty tons of ore per day to the smelters. Recently a new hoist, boiler and six-drill compressor were put in. The hoist is capable of working to 3500 feet depth. At the lowest workings — 860 feet—a streak of ore was found that assayed twenty-three ounces gold and 123 ounces silver. This ore has a metallic luster and the silver is much of it in native state. The presence of such high values in silver causes much surprise. On the ninth level, at 600 feet depth, a body of ore was found off the main shoot which assayed 15% lead, sixteen ounces silver, 3½% silica, 12% iron, 41½% zinc and only a trace of gold. This is still more interesting and a continuance of such discoveries is likely to cause a revision of the geology of the district.

The lease on the Jack Pot has expired and the property will be operated by the owner company.

The Alamo, on Gold hill, has been recently equipped with a shaft house and electric hoist. R. H. Burrows is superintendent.

The Lincoln, near Anaconda, belonging to the Virginia M. Mining Co., is under lease to E. M. De La Vergne, who is fitting up the property with a shaft house, steam hoist and other improvements.

The American tunnel and the Columbia and Woodman lodes, sold by E. E. Miller to the Merrimac Con. Mines Co. of Denver, are being worked by lessees, who have recently opened a rich vein of ore.

The Midnight, on Bull hill, is reported to have opened a vein of ore 7 feet wide.

The Sacramento, in the same locality, is being worked by lessees, who have a good showing.

The Lillie and Vindicator are operating the Gillett mill, which takes most of the ore of the two mines named.

The E. Porter Gold King, which was under lease for a long period, will now be operated by Mr. Porter, the owner.

The Teutonic is being energetically developed by four sets of lessees.

The Dillon, in charge of J. P. Horgan, has just finished sinking to the 700-foot level. Work will now proceed in drifting and shipping. Three air drills are at work. The February shipments consisted of six cars and those for March were four cars.

The Monument is operating and shipping under lease to the Winners G. M. & L. Co., in control of Spencer and others. The property belongs to Everett, Williams, Woodward & Reed.

The Granite has done little since February 1st, but is now preparing for active work. The 300 H. P. electric motor for hoisting, installed several months ago, seems to have been unsatisfactory. Either a new electric hoist or a steam hoist will supplant it.

The Ajax has the foundation ready for its new first-motion, double-reel, flat-cable Corliss hoisting engine, with air-actuated brakes and clutches. The cylinders are 20x48 and will develop 550 H. P. Additional boiler capacity of 250 H. P. is also being provided. The present three-compartment shaft, 600 feet deep, will be sunk deeper. The new machinery, furnished by the Hendrie & Bolthoff Manufacturing & Supply Co. of Denver, is being installed under the directions of Master Mechanic Cleaver of the Ajax.

The La Bella M. W. & P. Co. at Goldfield, whose plant develops electric power and compressed air, will put in an additional 1000 H. P. engine and generator. Instead of increasing their compressor power at the main plant, and conveying air to the mines requiring it, the plan now is to put in compressors at the various mines, each to be operated by an electric motor attached to it. In other words, the company will undertake to supply mines with compressors and operate them by electric power from the central power station. However, their present fifty-drill compressor is occupied to its full capacity supplying drill power to the various mines in the district. At present the plant develops a capacity of 1200 K.W. Asa Fisher is the new manager.

The Portland laid off 200 of its force of 500 men on the 5th inst., the primary purpose of which is believed to be to restrict the production to the high-grade ores pending the dispute with the smelters, mills and railroads on the question of treatment charges and freight rates. In the meantime the occasion is considered opportune for repairing boilers and machinery and adding new features.

Inquiry at the offices of the Anaconda and Victor mines discloses the information that work on these two properties is not being aggressively pushed at present.

Shipments from the Last Dollar for March amounted to 1350 tons of mill ore and 325 tons of smelter ore.

The Pinto shipped 420 tons of ore in March, some of it high grade.

The Vindicator's March shipments amounted to 3000 tons.

Victor, April 6. WASCOTT.

(Special Correspondence).—The ore tonnage of Cripple Creek district is being considerably curtailed as the result of the discordant relations between the mine owners on the one side and the smelters, mills and railroads on the other. The controversy grew out of the advance in treatment charges and freight rates about the first of the year. The 1899 treatment charges, including freights, made by the cyanide and chlorination mills on district ores were as follows: Ores running ¾ oz. and less, $7 per ton; 1¼ to 1½ oz., $9.25 per ton; 1½ to 2 oz. and over, $10 per ton; $20 per oz. was paid for gold extracted. The 1900 treatment charges, including freight, made by the same works are as follows: Ores running up to ¾ oz. gold, $8 per ton; ¾ to 1 oz., $9; 1 to 1¼ oz., $10; 1¼ to 1½ oz., $11; 1½ to 2 oz., $12; 2 to 5 oz., $13; over 5 oz., $14. For all ore running 2 oz. and less, only $19 per oz. is allowed for gold extracted; that running above 2 oz., $19.50 per oz. It is figured that, taking into consideration the price paid for gold, the 1900 rates by the mills and roads amount to an average advance of about $3 per ton over 1899 charges.

The 1899 smelter charges were $12 per ton, including freight, on district ores running 2 oz. gold and over, with an allowance of $20 per oz. for gold extracted. The 1900 smelter rate, including freight, on district ores is $13 per ton for ores running up to 5 oz. gold and $14 per ton for ores running above 5 oz. gold, with the price of gold extracted fixed at $19.50 per oz.

The above is believed to be correctly stated, and it will be seen wherein the mines have their grievance. The miners, while they still ship their high grades, are disposed to curtail their output of low and medium grades, while contending for more favorable rates.

The smelters, during the shutdown last year, accumulated a large reserve, which they claim had not been reduced much by the first of the present year; and they claim the advance was the business consequence of being surfeited with a larger tonnage of ore than they could handle. The further contention is made that the Cripple Creek ores pack in the furnaces, retarding the work, and that the smelters are preferably in need of such lead-silver ores as come from Creede, on which they get a $10 treatment rate. It is also asserted that, as the present ore reserves are worked off, treatment charges will drop. The March tonnage, which went from the district to the smelters, was from 12,000 to 13,000, which probably is not much less than usual, though this was confined to the higher grades.

The cyanide and chlorination mills at Florence handled 10,250 tons in March; the plants at Colorado City and Gillett handled about 9300 tons and the five mills in the district about 6000 tons, making a total of about 25,550 tons, which is far below their full capacity. It is generally conceded that ores running from ¾ up to 2 oz. gold are classed as milling ore; and when the mines withhold this class of ore, it soon makes an appreciable effect on the industry of the district. As has often been shown in the columns of the MINING AND SCIENTIFIC PRESS, the cyanide and chlorination mills of this section, including those under construction, have a capacity of over 2000 tons per day, and it can not be doubted that existing difficulties will soon be adjusted so as to permit both mines and mills to profit by each other's activity. WASCOTT.

Cripple Creek, April 7.

The gross output of the Cripple Creek district for March was $2,293,128. The Gillett, Brodie, Colorado Ore Reduction Co.'s plant at Arequa and the Economic at Eclipse gulch treated 7968 tons of ore of a bullion value of $192,128. The Colorado-Philadelphia Reduction Works at Colorado City treated 9500 tons of a value of $313,500. The three mills at Florence—the Metallic, El Paso and National—treated 14,650 tons of a value of $412,500. The miscellaneous plants, such as the Detroit, Oneida and other plants, handled ores to the value of $25,000, making a total for mill-grade ores of $943,128. There was treated by the smelters 18,000 tons of ore of an average value of $75 a ton, making $1,350,000.

The Portland mine uses thirty-four air drills, two-thirds of them in development work. The mine is producing 4500 tons a month.

During March Stratton's Independence produced 3200 tons of ore, averaging $78 to the ton. The gross production amounted to $249,000, and the profit is locally reported to be 56% of that amount.

IDAHO.

LEMHI COUNTY.

At the Bingham placer at Gibbonsville water has begun to flow and active handling of gravel is resumed. The snowfall in that region, as in neighboring ones, has been distressingly light.

MONTANA.

DEER LODGE COUNTY.

The French Gulch Dredging Co. has incorporated; principal place of business Anaconda; capital stock $200,000; trustees, M. Donahoe, M. B. Greenwood, T. C. Davidson, W. R. Allen, H. R. Whitehill.

NEVADA.

LYON COUNTY.

The Dividend Co.'s ore reduction plant at Como is reported in successful operation. Some of the concentrates are said to go $500 per ton.

NEW MEXICO.

(Special Correspondence).—Great activity exists at Bland and Albemarle in the Cochiti district. It is estimated there are 1500 men employed by the various mines and mills, and that there are 3000 permanent residents. Fifty buildings have been erected at Bland within the last four months.

The Albemarle is said to be making a good profit and has a large tonnage of ore blocked out which averages $9 per ton in value, and it is claimed this is being mined and milled at a cost of $4 per ton. The mill has been enlarged and will soon have a capacity of 10,000 tons of ore per month. The Navajo tunnel, now in 400 feet, is expected to cut the main ore body within 800 to 900 feet.

Bland, April 9.

GRANT COUNTY.

The mines, machinery and mill of the Golden Giant M. Co. at Pinos Altos have been bonded to W. S. Gage of Boston, Mass., who is unwatering the property.

SANTA FE COUNTY.

Mgr. J. T. McLaughlin of the Santa Fe G. & C. Co., operating near San Pedro, says work preliminary to the erection of the copper smelter is being pressed. The new plant will have a daily smelting capacity of 200 tons copper ore.

The Magdelena M. & S. Co. has its Cerrillos smelter in operation.

OREGON.

JOSEPHINE COUNTY.

At Gold Hill the Humason 10-stamp custom quartz mill is expected to be in operation May 1.

UTAH.

JUAB COUNTY.

The Silver Park mine at Silver City is closed down temporarily and a 2-cent assessment levied.

SALT LAKE COUNTY.

The whole force of the Germania smelter at Murray are on strike. Their committee demands a 35-cent per day advance in wages, the laborers to receive $1.75 instead of $1.40, other men to receive $1.85 instead of $1.50, the furnace men to receive $2.25 in place of $1.90. The superintendent asked them to wait until he could hear from the officers of the smelter trust at Denver. On the 11th the smelter combine refused to grant the demand for increased wages. Employes went on strike.

WASHINGTON.

OKANOGAN COUNTY.

(Special Correspondence).—Eight miles east of Loomis in a depression on the southeast portion of Palmer mountain is Wannicut lake. (See illustrations on pages 397 and 401.) Surrounding this lake are fine showings of mineral, particularly on the south and west sides. It has been a custom in this district of grouping a number of locations which are known by the best showing claim in the group; among the most prominent on this part of the mountain is the Wehe group, consisting of twenty-six locations, several millsites and about 300 acres of surface ground which runs to and occupies a large part of the shore of the lake. In July, '99, this property was acquired by Messrs. Preston, Turner and Hughes of Fargo, N. D., forming a corporation, the Wehe Con. G. M. & M. Co. Associated with them are Chas. Hofer and Wm. Von Stemwehr of Cincinnati, Ohio, who financed the company, putting capital in the treasury for carrying out a plan of development which includes a 3000-foot tunnel to crosscut five cropping parallel veins, and a 500-foot shaft following the footwall of the fifth vein to connect with the tunnel. The tunnel is now in 400 feet and being continuously driven; it has already cut one vein of fair width assaying good values; the shaft is down 200 feet and the vein crossed from foot to hanging wall and found to be 14 feet in width and well mineralized across. As soon as a gasoline hoist can be installed it will be continued to 500 feet and a level run on the vein at each 100 feet sufficient to fully prove it. Gold predominates in the ore and assays run about $20, while it carries a fair amount of silver. The vein the shaft is being sunk on crops at intervals for 9000 feet, while another has croppings similar for 6000 feet, the others not being so prominent. The manager, E. C. Brown, expects that by the end of this year the work will be so far advanced that a treatment method can be decided upon. Lumber and timbers are being delivered at the mine and surface improvements begun. This and all other working properties on Palmer mountain are benefited by the deep workings in the Palmer mountain tunnel, as it forms a precedent for working plans. The Wehe property is about four miles in a tangent from that tunnel and has many of the same features. This latter property has crossed with 2850 feet of tunnel eighteen well defined veins, any one of which, with the same depth and showing, might be classed as a mine.

That this is not theoretic is proved by the Palmer mountain tunnel and others, as, for instance, the Black Bear, illustrations of which appeared in a recent number of the MINING AND SCIENTIFIC PRESS. The shaft is down 250 feet; drifts run each way to a vein, one having 2½ feet and the other 3½ feet of ore, equal in quality to anything above it, assays running

all the way from $24 upwards in gold; these veins go down nearly vertical. Perhaps the most remarkable vein yet encountered on Palmer mountain is in the Bull Frog, they having now gone through 70 feet of vein matter in the drift from the bottom of 130 feet. This ore is easily cyanided, as it contains no copper. Mill tests have shown a saving of $18.25 from ore assaying $19.50.

With three mills running the values of ores generally are holding well up to $15 and the cleanup from them this month—their capacity being with present machinery 2000 tons—is conservatively estimated at $30,000. These are the Black Bear, Golden Zone and Okanogan Free Gold, and it starts the district off at the first of the year as a producer. The three mills mentioned have machinery on the ground and en route to double their present capacity, to be soon installed.

While only actual mining operations are wanted by the MINING AND SCIENTIFIC PRESS, as is well known to your correspondent, still something a little beyond those are due to the State of Washington, which has only within the past two years entered the list of States where gold in paying quantities is mined, and especially to a section of the State in which $500,000 have been expended in the purchase and development of properties in the past year, and another $500,000 provided for the present year's work. This capital, with only one exception, has come from the moneyed centers of the United States, an evidence of the growing confidence in the mining industry, and the American public, it seems, have awakened to the great profits in the business and that it has entered the list of strictly legitimate business callings.

FOREIGN.

BRITISH COLUMBIA.

At Lillooet the Brett mines have been bought by Ashcroft men for $150,000—$10,000 down, balance in installments. It is the intention of the new owners to put in a second 10-stamp mill.

Mgr. A. O. Egbert of the Star M. Co. believes the labor question will soon be settled satisfactory to both sides. "The prices agreed upon and now in force in the Slocan gives general satisfaction. The recognition of the union as a whole cuts but little figure at the present time and is a matter that will adjust itself without any material change from the present status of things. The conditions brought about by the strike of last June are by reason of the recent agreements between mine owners and miners fast being displaced by more healthy and normal contions. The mines in the immediate vicinity of Ainsworth have not been working full force the past year, but now that the wage question is about settled, I look for a general revival."

CHINA.

S. Newhouse and associates have three concessions from the Chinese Government: the exclusive right to mine for precious metals and precious stones in the district of Jehol, northern China, 160 miles north of Pekin; the right to operate the coal mines at Shish-Meh-Chai, on the east coast of China; all the timber rights and mining rights for the precious metals, iron and coal on both sides of the Yalu river. A. Mathez, W. Irelan and E. B. Field will have charge of the preliminary work.

MEXICO.

R. O. Towne of the City of Mexico and H. W. Praetorius, Mgr. Sombrerete M. Co. of Parral, Chihuahua, will establish a custom smelter in Santa Barbara district near Parral, to which point the Mexican Central is extending its Parral branch line.

THE KLONDIKE.

(Special Correspondence).—All Dawson, and nearly all the Klondike, is off to Cape Nome. This is now almost entirely a country for capital. The '99 output was $16,000,000: 1900 promises to double that. This is largely because of improved methods in working, mainly the use of thawing by steam instead of wood. This has reduced the cost of working per square yard from $15 to about from $3 to $5. You can only reckon the square yard, because the depth of the pay varies very much, and you can't figure by the cubic yard. Of course, as freights and the cost of appliance comes down, this will be materially reduced. Though capital does not care much for gravel, London is becoming interested in the Klondike. Even now, with the Dutch war on, London men have sent in over $250,000 since New Years.

Dawson, Y. T., March 20.

The Dawson Daily News says: It has been demonstrated that ground can be worked in summer with proper machinery cheaper than in winter. The summer work has many advantages. The miner need not work one day in doubt as to what he is doing. In winter one works in the dark, literally and figuratively. The pannings here and there by which a man tries in the winter season to keep track of the pay and to test the value of his ground, is really no test at all. For instance, a man may find a $6 pan, and by that standard he has very rich dirt. But 1 foot away from the spot where he got that pan he may be able to scare up no more than a few colors. Then suppose, in trying for a test of the value of the claim, the man had not by accident struck this rich little pocket—this $6 pan? The claim would be condemned as valueless. The only way that ground can be really tested is by washing a quantity of dirt in the sluice boxes, and that can only be done properly in summer. In summer the man can carry his dirt directly out of the mine into the sluice boxes and dispose of it at once. He may clean up every day if he wishes to and knows just exactly the kind of ground he is going through. In this way he can save, too, fully one-third the expense in the double handling and double thawing of the ground. After this winter there will be very little winter work done here.

Personal.

DUNCAN MCVICHIE of Mercur, Utah, is visiting California.

PROF. JENNEY, Missouri's State Geologist, is examining Utah mines.

MGR. LAHAISE now has charge of the Draper mine, Tuolumne Co., Cal.

GEO. W. MAYNARD of New York City is inspecting copper property at Alberni, B. C.

P. GEO. GOW of the Jumper mine has returned from San Francisco to Tuolumne Co., Cal.

T. H. OXNAM, Gen. Mgr. Bully Hill mines, Sallee, Cal., has returned from San Francisco.

ED J. FOWLER, metallurgist at Campo Seco, Calaveras county, Cal., is in San Francisco.

A. P. REDINGTON of San Francisco has returned from a trip to Shasta county mining properties.

JAMES ANGUS SNEDAKER, of Denver, Colo., recently made a professional trip to southern Arizona.

F. PANTER, managing owner Evening Star mine, Whitehouse, Cal., has returned from San Francisco.

C. A. HAMILTON of San Francisco is on a business visit to the Cleveland Con. mines, Shasta county, Cal.

J. E. KEELER of the Lick, Cal., Observatory has been elected president of the Astronomical Society of the Pacific.

J. W. FRANK of Red Bluff, Cal., leaves next week to take charge of mining properties for D. M. Burns in Durango, Mexico.

W. S. ADDITON, formerly chemist for the Portland Gold Extraction Co., Sawyer's Bar, Cal., has gone to British Columbia. He is succeeded by Mr. Brant.

FORBES RICKARD of Central City, Colo., has been engaged by the Venture Corporation of London to go to the east coast Siberia to examine the beach sands opposite Cape Nome.

H. W. HIXON, late Supt. East Helena, Mont., smelter, goes next week to London to consult his principals, who have employed him to construct and operate a copper and nickel smelter in Canada.

THE election last week of H. H. Rogers Pres. and W. G. Rockefeller Treas. Butte & Boston Con. Copper M. Co., is understood in the East to confirm reports that amalgamated copper stockholders had secured large interests in the Butte & Boston, and strengthens the opinion that the latter company will eventually be merged in the Amalgamated Copper Co.

Commercial Paragraphs.

PRESIDENT JNO. SIMONDS of the Simonds Saw Co., San Francisco, has presented to the College of Mechanics of the California State University a Marsh steam pump.

THE Union Gas Engine Co. has moved to its large new building, corner First and Clementina Sts., San Francisco, and now has every desired convenience and facility for conducting its business, enabling the company to fill orders with even more than former promptness.

MCCARTHY & MACKAY, 226 Market St., San Francisco, supply asphalt paper pipe and guarantee it to stand 75 pounds pressure. They claim it to be the lightest pipe in the market, will not break, easy to lay and put together, and, being a nonconductor, water in it will not freeze at ordinary temperatures.

IN view of the rush this season to Cape Nome and Alaska, and the necessity of suitable machinery to work the beach placers, attention is directed to the Little Alaska gold washer, which has now, after some years experience, established its claim to favorable public notice. They were used in Alaska last year with success, and this year the manufacturers expect a much greater number of them will be used. Messrs. Russell & Kinsey of Los Angeles, Cal., the owners of the patents covering this washer, report a demand for it from all parts of the country, shipments having recently been made to placer mines in Eastern Siberia, Alaska, Northwest Territory, Canada, Mexico, Nicaragua and other South American countries, and also to different placer fields of the United States.

Industrial Notes.

—The Red Bluff Electric Power Co. has incorporated at Red Bluff, Cal., to furnish light and power; capital stock, $250,000; subscribed, $185,000.

—With the Colorado Midland and Colorado Southern railroads at Leadville, the latter road will lay a third rail to accommodate the cars of the former.

—On the 11th the U. S. Senate passed the Pacific Cable bill, appropriating $3,000,000 for the construction of a cable between San Francisco and Honolulu.

—One result of the Transvaal war is noticeable in the fact that U. S. uncut diamonds during February amounted to $956 as against $1,018,880 in February, '99.

—The value of the silver coins of the world has increased from $0.59091 per ounce fine on Jan. 1, 1900, to $0.60220 on March 31, making an increase of $0.01129.

—The Peyton Chemical Works have bought a site near Martinez, Cal.—350 acres of uplands and 363 acres of marsh lands—for $20,000. In addition to manufacturing chemicals and smokeless powder, dynamite will also be made.

—The following table gives a comparison of prices in the United States and England:

Article and Quantity.	U. S. price.	Eng. price.
Lead, 100 lbs.	$4 70	$3 64
Litharge, lb.	8⅜	4¾
Wire, smooth, 100 lbs.	3 05	2 50
Barb wire, galv., 100 lbs.	3 80	2 39
Wire nails, 100 lbs.	3 38	2 55
Iron ore, ton.	6 125	5 25
Tin plate, 100 lbs.	4 85	3 60
Sheet steel, 100 lbs.	2 70	2 07
Galvanized iron, 100 lbs.	3 78	3 23
Steel beams, 100 lbs.	2 30	1 80
Borax, refined, lb.	075	034
Lime, bbl.	90	62
Cream of tartar, crystals, lb.	22½	159
Bleaching powder, lb.	2¾	015
Castor oil, lb.	12¼	066
Caustic soda, 100 lbs.	2 42	1 84
Cement, Portland, best, bbl.	2 55	1 11

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR THE WEEK ENDING APRIL 3, 1900.

646,532.—GOLD DREDGE—S. Babare, Tacoma, Wash.

646,567.—TIRE HEATER—E. Beeson, Fresno, Cal.

646,797.—PISTON PACKING—M. E. Briggs, Alameda, Cal.

646,811.—TACK PULLER—J. H. Driller, Los Angeles, Cal.

646,522.—CAR VENTILATOR—G. A. & R. F. Dunn, Dinuba, Cal.

646,523.—SPRAYING APPARATUS—G. A. & R. F. Dunn, Dinuba, Cal.

646,640.—LIFT PUMP—G. H. Evans, Oroville, Cal.

646,822.—FEED BOX—F. Galloway, Central Point, Or.

646,538.—WELL AUGER—J. Hahn, Colegrove, Cal.

646,734.—CONDIMENT HOLDER—M. L. Hansen, Oakland, Cal.

646,432.—ADVERTISING DEVICE—Heiron & Toffelmeier, San Leandro, Cal.

646,553.—WHARF—H. C. Holmes, S. F.

646,832.—FLUSHER—S. C. Houghton, S. F.

646,737.—FISHING REEL—J. Howe, Tacoma, Wash.

646,843.—WATCH DIAL—E. Krahenbuhl, San Rafael, Cal.

646,845.—CURRYCOMB—C. F. Laflin, Asotin, Wash.

646,441.—MINER'S PICK—J. B. Lucas, Valley Springs, Cal.

646,447.—AIR BRAKE—C. E. Morgan, Portland, Or.

646,867.—IGNITER—O. Owens, S. F.

646,546.—BICYCLE BRAKE—P. W. Pratt, S. F.

646,560.—INK WELL—D. H. Rowe, Oakland, Cal.

646,505.—GOVERNOR—J. N. Rundle, Santa Barbara, Cal.

646,509.—BILL-CARRYING APPARATUS.—A. W. Thierkoff, Redding, Cal.

646,510.—SPRING CLAMP—A. W. Thierkoff, Redding, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AUXILIARY MOTORS FOR VESSELS.—R. T. Power, New Westminster, Canada, three-tenths assigned to R. D. Perry of San Francisco, Cal. No. 646,374. Dated March 27, 1900. This invention relates to an attachment for vessels, which is designed to produce an independent power to be used for any desired purpose, either upon sailing or steam propelled vessels. It consists of one or more open-ended tubes or passages, extending through the vessel below the water line, and essentially parallel with the keelson. Within these tubes turbines or other water wheels are journaled, so that the rush of water through the tubes, caused by the movement of the vessel through the water, will propel the turbines or wheels. Connection is made in any suitable or desirable manner with the shafts of these wheels, and the power thus derived may be applied either to an electric generator, and through the generator, or directly, if it is a steam-propelled vessel. The power thus derived may be transmitted to a propeller shaft to assist in propelling the vessel.

WHARF CONSTRUCTION.—H. C. Holmes, San Francisco, Cal. One-half assigned to Carl Uhlig, same place. No. 646,553. Dated April 3, 1900. This invention relates to improvements in wharves and like structures, and its object is to provide a stronger and more permanent foundation than can be had by the use of single piles as usually driven, and means to provide for protecting the wharf from the shocks caused by vessels or other floating objects striking against it. It consists of piles driven in clusters, and a wooden enclosing cylinder sunk around the piles with its lower end embedded in the mud, and a filling of concrete which surrounds the piles within the cylinder. Exterior to the line of the wharf structure which is built upon these piles are a series of fender piles at a distance from the edge of the wharf and ribs or timbers are bolted thereto in lines above and below the wharf timber and independent thereof. Springs are placed intermediate between the fender piles and the edge of the wharf, and these are of sufficient strength to resist the pressure when a vessel strikes against them, and prevent damage to the wharf itself.

INK WELL.—D. H. Rowe, Oakland, Cal. Assignor of two-thirds to W. E. Gibson and C. H. True, of same place. No. 646,560. Dated April 3, 1900. The object of this invention is to provide a well with means for fixing it in an opening or socket in the desk, a rotatable cap having a cover normally closed by gravitation, through which cover when opened the well can be replenished. The rotatable cap has an opening in the side coincident with a similar opening in the top of the well so that when these openings are brought in line a pen can be dipped in ink through the connected openings. When the well is out of use the cap is turned and a lip or flange upon the cap covers the opening and prevents the entrance of dust and the evaporation of the ink.

SPRAYING APPARATUS.—G. A. & R. F. Dunn, Dinuba, Cal. No. 646,523. Dated April 3, 1900. This invention is designed for the spraying of fruit trees, plants and for other like purposes. It consists of a main containing reservoir, a supplemental closed chamber, with connections by which liquid is delivered from the first to the second chamber, an air pumping mechanism connecting with the closed chamber and through it discharge air into the main chamber. Independent liquid and air conveying pipes are lashed together and a nozzle is provided common to both, with an automatic discharge regulating valve for either liquid or air; means are provided for agitating the liquid to keep it thoroughly mixed before being discharged.

Recently Declared Mining Dividends.

Silver King, Utah, 50 cents per share, $75,000	April 10
Monarch, Colorado, 12 cents per share, $120,000	April 6
Portland, Colorado, 2 cents per share, $60,000	April 15
Plumbago M. Co., California, $12,000	April 2
Mammoth M. Co., Utah, $40,000.	April 15
Daly-West M. Co., Utah, $37,500.	April 15
Favorite M. Co., Colorado, $48,000	April 20
Honduras Rosario M. Co., 10 cents per share, $15,000	April 16
Mercur M. Co., Utah, $25,000	April 20

Latest Market Reports.

SAN FRANCISCO, April 12, 1900.

SILVER—Per oz., Troy: London, 27⅜d (standard ounce, 925 fine); New York, bar silver, 59½c (1000 fine); San Francisco, 59½c; Mexican dollars, 48½c.

COPPER.—New York: Lake, 1 to 3 casks, 17.25 cash; carload lots, 17.00; Electrolytic, 1 to 3 casks, 17.00; carload lots, 16.87½; Casting, 1 to 3 casks, 17.00; carload lots, 16.75. San Francisco: 17½@18. Mill copper plates, 21½c; bars, 23½@25c.

LEAD.—New York, $4.72½; St. Louis, $4.60; San Francisco 5c, carload lots 5¼c, 1000 to 4000 lbs.; pipe 7½, sheet 8¾, bar 6¼c. London, Soft Spanish Lead, £16 13s 6d= 3.4c per lb.

SPELTER. — New York, $4.77; St. Louis, $4.70; San Francisco, ton lots, 6c; 100-lb lots, 6¾c.

ANTIMONY. — New York, 9½c; San Francisco, 1000-lb lots, 11c; 300 to 500 lbs., 12@14c; 100-lb lots, 15@18c.

BABBITT METAL.— San Francisco, No. 1, 10c.

PHOSPHORUS. — F. o. b. New York or Philadelphia, 50@55c ₱ lb.

SOLDER. — Half-and-half, 100-lb. lots, 21½c; San Francisco, Plumbers', 100-lb. lots, 18¼c.

IRON. — Pittsburg, pig, No. 2, foundry, $23, gray forge, $21.50; San Francisco, bar, per lb., 3¼c.

STEEL.—Billets, Pittsburg, $33; sheet bars, $37; San Francisco, bar, 12c to 20c per lb.

QUICKSILVER. — New York, $52.50; London, £9 12s 6d; San Francisco, local, $51.50 ₱ flask of 76½ lbs.; export, $47.50.

PLATINUM.— San Francisco, crude, $16 ₱ oz.; New York, $18; manufactured, $19.50@22.00.

FERRO-TUNGSTEN.—New York, 37c, 40c; San Francisco, 75c (60%).

FERRO-MANGANESE. — Pittsburg, 80%, $125.

SITUATIONS WANTED.

FIRST CLASS QUARTZ MILL MAN
expert on rebellious ore, wishes position as amalgamator, or will take charge of quartz mill. Best of reference furnished. Address J. M., this office.

Experienced Assayer and Mill Man
desires engagement. Has been assayer in gold mines and smelters and has had charge of stamp mills. Address M. A., this office.

POSITION BY A COMPETENT ASSAYER AND MINING ENGINEER. Understands cyaniding, milling, roasting of ores, etc. Has had experience. Best of reference. Address F. W., this office.

ACCOUNTANT AND SECRETARY open for engagement after regular office hours. Work for incorporated companies a specialty; organization meetings, accounts opened or adjusted, etc. First-class references. Address L., care of this office.

COPPER MINE IN MEXICO.
I have a large copper property, situated about seven miles from the great plant of the Moctezuma Copper Co. of Nacosari, described in the March 31st issue of this paper. The surface indications and the geological formation of the two properties are very similar, and my developments so far made encourage the belief that the mineral deposit is of equal extent and value. Owing to the improved conditions resulting from the advent of the railroad and the erection of the big smelter so near, making a market for the ore, this property can be made self-developing to any extent by the expenditure of a comparatively small sum. Any interested party can make a good deal of some kind by communicating with

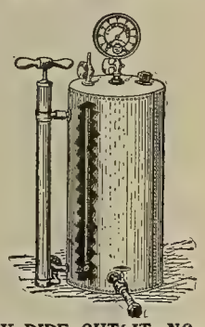
CATALOGUE ON APPLICATION.



SMOOTH-ON CASTINGS.

An iron cement in powdered form, for repairing leaks or fractures in steam or hydraulic work, applied by mixing with water; hardens quickly and expands in hardening. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simple constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

GATES IRON WORKS.

THE TREMAIN STEAM STAMP MILL

has made many fortunes for its owners. It costs but little money. Can be transported anywhere.

CHICAGO, ILLS., Jan. 18th, 1900.

GATES IRON WORKS, CHICAGO, ILLS.

MY DEAR SIRS:—

Replying to your letter of the 17th inst., asking what we have done with the Tremain Mill at the Storm Cloud Gold Mines near Prescott, Arizona, in the past year, will say that we have been unable to run the Mill more than three days out of the week, owing to the fact that we have had, during the past year, but little rain. We were obliged to use settling tanks and save what little water we had, in order to run three days per week. The Mill has worked splendidly—in fact, it is a perfect little giant to do business with, where you have plenty of water for amalgamating purposes.

Enclosed I hand you a statement amounting to $20,210.72, which is the total product of the Mill for the twelve months, giving dates that we sent the bars to the mint at San Francisco and the amount we received for each bar.

I think the Tremain Mill is the best friend that a prospector or an individual who has practically a good mine can get hold of, to furnish him money to develop his property. I bought the Storm Cloud Gold Mines the last of June in 1897. In the fall of that year I bought, as you know, one of your Tremain Mills. From the day I started it it has paid all my developing expenses, and from the report made by the geologist of Arizona, December last, I now have $940,000 of ore blocked out, the expense of which has been paid from the net proceeds of the Tremain Mill. I have paid for over 1800 feet of development work with this Mill since I erected it two years ago last October. My experience teaches me that if anyone has any trouble with the Tremain Mill it is the fault of the man who operates it.

Yours very truly,

WHITING G. PRESS.

WHITE, ROGERS & CO.,

Contracting Engineers and Millwrights,

OFFICES, 306 PINE STREET, - - SAN FRANCISCO, CAL.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work. Easy adjustment. Little wear.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

SEND FOR CIRCULARS.

These Machines are Kept in Stock Ready for Immediate Shipment.

MINERS, ATTENTION!

SCHEPER'S HAMMER SLING.

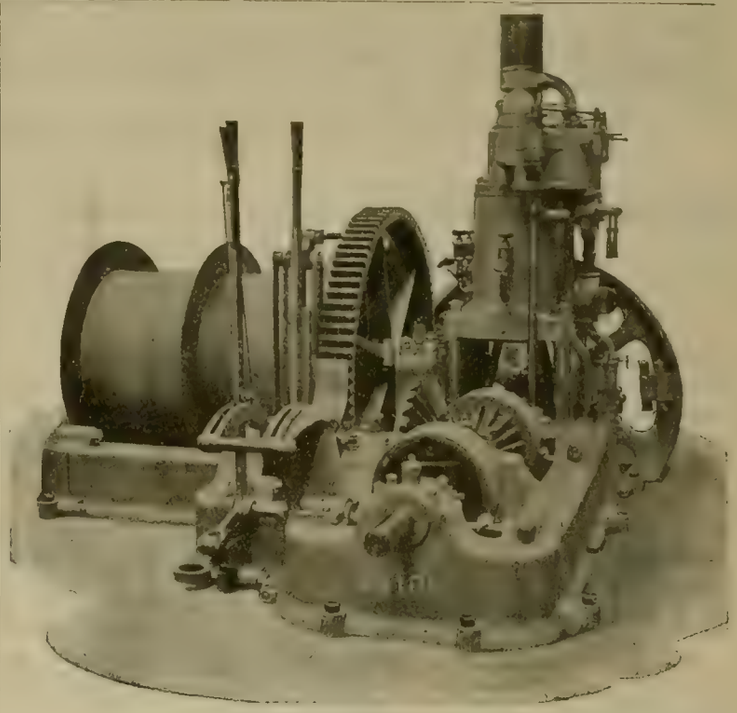
A Great Labor Saving Device.

THE above illustration of Scheper's Hammer Sling tells the whole story. It is seen at a glance that the weight of the hammer is carried on the wrist and forearm, by the sling, thus avoiding the firm and tiresome grasp necessary to hold the hammer in the ordinary method.

There can be no doubt that fully one-half the labor of using a hammer by the ordinary method is caused by the exertion of holding the hammer firmly in the hand to resist its weight and the centrifugal force of the swing. With the hand sling the hammer may be held perfectly loose in the hand and the fingers may be extended, as shown, and no grasp whatever made upon the handle, merely enough contact with the handle to preserve the direction of the hammer.

If a miner is so inclined, he may increase the weight of the hammer by at least 30% with scarcely any addition to the labor of using it.

This Hammer Sling is of the greatest advantage in the drilling of uppers, for it is this character of work that is ordinarily most severe; but it can be used with tremendous advantage in down holes.



To attach the sling to the hammer it is only necessary to drill a three-sixteenths of an inch hole through the hammer handle, about one-half inch from the hammer, as shown in the cut.

The Hand Sling may be removed in an instant and replaced when desired. The whole device weighs but one and a half ounces.

Miners suffering from strained wrist and finger cramps from using ordinary hand hammers will find it possible to continue work by using the Hand Sling. **Retail Price, 50 Cts. Discount to Dealers.**

RIX ENGINEERING & SUPPLY CO.,

MANUFACTURERS,.....519 HOWARD STREET, SAN FRANCISCO, CAL.

The above illustrates the "Union" 25 H. P. double cylinder divided drum mining hoist for double compartment shaft. Cages and cars balance each other, therefore power is only used to raise ore; cost of hoisting ore is therefore reduced to the minimum. Made in sections for mountain transportation.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

THE LITTLE ALASKA GOLD WASHER.

Price $6. Saves the Gold. *Weighs only* 7 1-2 Lbs.

After several years' practical use in different fields, our washer has established its superiority over all placer or beach washers. It is just the washer for Cape Nome; it was used extensively in Alaska last year with every success. In working the operator does not have to wet his hands and can stand in an upright natural position. It is just the washer for the poor man who has not the money to put in expensive machinery. It will do the work of ten men with gold pans. It is just the washer for the prospector, being light and easy to pack. Don't fail to write us if in need of a washer; we can save you *time, labor* and *money*. RUSSELL & KINSEY, 1237 Magnolia Ave., Los Angeles, Cal

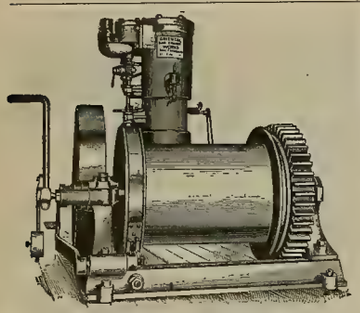
SPADONE'S CONCENTRATOR BELTS.

PATENTED.

This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and ¼ inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.



Send us your order for Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING, RUBBER PACKING and LEATHER BELTING.

DEWEY, STRONG & CO. 330 MARKET ST.

In GOLD MINING, if the ore is free and low grade it is milled (Fraser & Chalmers' Catalogue No. 4 tells about that). If the ore is rich and refractory it is shipped to smelter, and smelted (Fraser and Chalmers' catalogue No. 3 tells about that). If the ore is low grade and refractory it is concentrated (Fraser & Chalmers' catalogues Nos. 9 and 13 tell about that). If difficult to concentrate, leaching by the cyanide process is usual (Fraser & Chalmers' catalogues Nos. 4 and 29 tell about that).

A MODERN COPPER SMELTER.

THE COLORADO IRON WORKS CO.

ESTABLISHED 1860. DENVER, COLO.

—MANUFACTURERS OF—

Smelting Furnaces and Equipments

: : : FOR THE TREATMENT OF : : :

Gold, Silver, Lead and Copper Ores.

We build furnaces to drawings and specifications, and furnish drawings and full instructions for erecting.

We erect all furnaces at our works and carefully mark every piece before shipping. By this means, trouble in erecting at the smelting plant is entirely avoided.

We contract to build and equip smelting plants complete, of any required tonnage capacity above forty tons per day, at any desired location and put them into successful operation under guarantee. We contract to smelt a thousand tons of ore, more or less, before turning the plant over as completed under the guarantee.

We have in the past built more Blast Furnaces for smelting the ores of the valuable and the precious metals—gold, silver, lead and copper—than any other manufacturing concern on the American continent, and in the past year of 1899 we built more such furnaces than all others combined.

(SEE PAGE 421.)

Assay Office, Sampling Works

And Chemical Laboratory.

524 Sacramento Street, San Francisco, Cal.

The above illustration shows an operator taking an incline above the horizontal with BRUNTON'S PATENT POCKET MINE TRANSIT. The instrument is made especially for mining engineers, mine managers and superintendents, but its light weight and the ease with which it can be handled render it admirably adapted to the taking of topography and for geological field work. Write for catalogue B, giving full description of the instrument and all its uses, to

No. 043 BUTTON BALANCE, 10-inch beam. Sensitive to 1-100 Milligramme. This is a double-column button balance with all latest improvements, including our new adjusting device and rider rod lock. It is accurate and as rapid as a beam of this length can be. For an office doing a moderate amount of work, it is the best balance to be had for both gold and silver. For complete description and prices of this and other balances send for catalogue A to

ASSESSMENT NOTICES.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2nd day of April, 1900, an assessment (No. 23) of 2 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of May, 1900, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 28th day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

BEST & BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of April, 1900, an assessment (No. 70) of fifteen (15c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of May, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 31st day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary.

Office—Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3d day of April, 1900, an assessment (No. 16) of Ten ($10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of May, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 5th day of June, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

OSCEOLA CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Plymouth, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of March, 1900, an assessment (No. 9) of one (1c) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 307 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of April, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

HOLLAND SMITH, Secretary.

Office—307 Montgomery street, San Francisco, Cal.

SOUTH PALOMA GOLD MINING COMPANY, Limited.—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of March, 1900, an assessment (No. 2) of six-tenths (6-10) of a cent per share was levied upon the capital stock of the corporation, payable immediately to the secretary, John F. Barnett, at Room 22, No. 222 Sansome St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23rd day of April, 1900, will be delinquent and advertised for sale at public auction; and unless payment be made before, will be sold on MONDAY, the 14th day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

Embodying all that experience and practical working have demonstrated as valuable in this class of machinery.

The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

THE HALLIDIE ROPEWAY

For Transporting Ore, Fuel, Earth, Sugar Cane, etc., by Wire Ropes.

SIMPLE, ECONOMICAL, PRACTICAL, DURABLE.

LOADS MECHANICALLY. DUMPS AUTOMATICALLY.

WIRE TRAMWAYS (Single and Double Rope Systems),

Cableways, Transmission by Wire Ropes,
Incline Planes, Cable Grips,
Logging by Cables, Automatic Loaders,

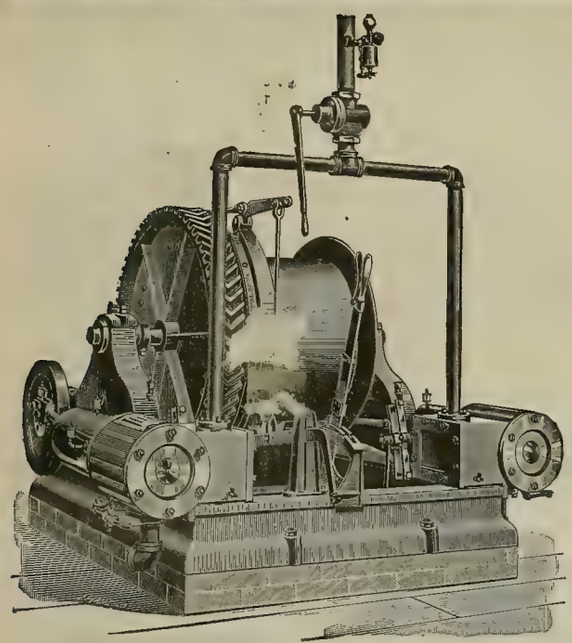
PLOWING, SCRAPING AND TRANSPORTING by Wire Ropes,

DESIGNED, SUPPLIED AND ERECTED. Estimates Furnished.

CALIFORNIA WIRE WORKS, - 9 Fremont St., San Francisco, Cal.

Improved GRIP PULLEY.

Patents Nos. 483,442; 610,353.



EFFECTIVE, SIMPLE, AUTOMATIC.

Saves Wear on Wire Rope and Cable.

Send for Illustrated Pamphlet.

Correspondence Solicited.

FIXED DRUM ENGINE.

PARKE & LACY CO.,

21 and 23 FREMONT STREET, SAN FRANCISCO, CAL.

Hoisting and Pumping Machinery

...FOR...

MINE PROSPECTING AND DEVELOPMENT.

SOLE AGENT FOR THE

Ingersoll-Sergeant Rock Drills and Air Compressors.

LICENSEE FOR THE MANUFACTURE AND SALE OF THE

Ropp Straight Line Furnace for Roasting, Chlorinating and Desulphurizing Ores.

Huntington Centrifugal Roller Quartz Mill,

Simmons Ball-Bearing Hydraulic Giants, Paul Ball Mill.

WE CARRY IN STOCK

Horizontal, Vertical and Portable Engines and Boilers,
Rock Breakers, Cornish Rolls, Pulverizers, Concentrators, Ore Feeders,
Hoisting Engines, Horse Power Hoisting Whims, Water Wheels, Steam Pumps, Ore Cars, Wire Rope, Ore Buckets, Water Buckets, Skips,
Blowers and Exhaust Fans, Shafting and Pulleys, Belting, Oils and Mine Supplies.

SOLE AGENT FOR

Manganese Steel Shoes and Dies. Bullock Diamond Drills.

KNOWLES PUMPS AND PULSOMETER PUMPS.

Estimates Furnished for Complete Plants for Hoisting Works, Smelters, Concentrating and Stamp Mills.

DEWEY, STRONG & CO., Patent Agents, 330 Market St., S. F., Cal.

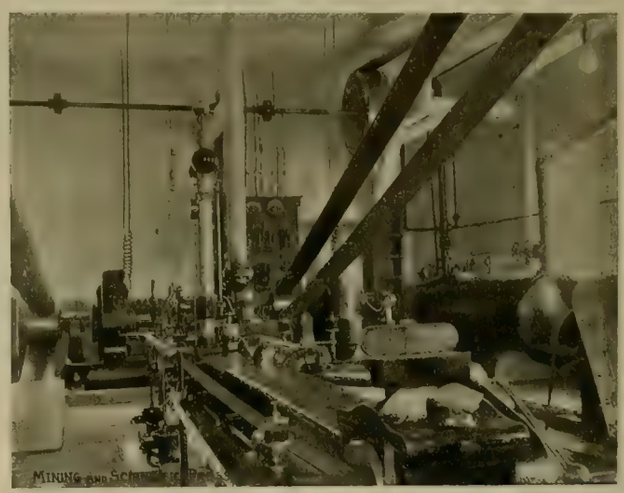
MINING AND SCIENTIFIC PRESS.
AND PACIFIC ELECTRICAL REVIEW.

No. 2074.—VOLUME LXXX. Number 16. SAN FRANCISCO, SATURDAY, APRIL 21, 1900. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Past and Present in Montana.



In the postoffice at Clancy, Mont., is a plain door made in 1865 for T. M. Hill, the then and present owner of the building. He has the original bill. Here are the items: Forty feet of lumber at 25 cents, $10; eight panes of glass 10x12 at $1.50, $12; two butts (and screws), $2.50; one knob lock, $7; putty, $1; paint, $1. Total, $33.50.

To-day such a door would cost in Clancy about $3.50. When that door was made Montana miners were paying $125 in gold for a 100-pound sack of flour; $1 per pound for potatoes and everything else in proportion; mining machinery, even such as was made in that crude day, was almost prohibitory in its price. Pioneer prospectors blazoned with their bones the weary way where now dash by the palace cars. Montana copper that makes possible the electrical advance of the Orient is now mined and refined by processes undreamed of when the door in Clancy was made for what ten doors could now be furnished. This brief note from the plain records of one generation ago is but illustrative of precisely the same conditions as contrast between past and present in any of the great commonwealths of this west half of America. Two things are to be noted. It was mining that made possible such advance as is here strikingly noted; for to scientific mining is due nearly all of wealth and prosperity in this west half of America; and gold is worth no more, no less, to-day than thirty-five years ago when its purchasing power was less than one-tenth in some cases what it is to-day. It was not the gold then nor now; it was and is the genius and intelligence, the daring progress of the American miner that created the contrast afforded between the past and present. Progress and prosperity are the created result that made possible the settlement and development of this entire west half of America. By mining men of ability made their fortunes; and when, through speculation, through unwise or unlucky investment in cattle, or politics, or real estate, they lost their money, it was the mines that put them on their feet again financially, in Montana, California or elsewhere.

TABLE OF CONTENTS.

ILLUSTRATIONS.—DeLamar and April Fool Mines, DeLamar, Nevada; Section of Engine Room, DeLamar Mill, DeLamar, Nevada; View of DeLamar Mill, DeLamar, Nevada; Drills in Use at the Gold Bank Mine, Forbestown, Cal., 425. Mt. Whitney Power Co.—Tunnel Where Water is Diverted from River into Flume; Hoisting Pipe up Mountain Side, Mt. Whitney Power Co.; Flume, Kaweah River Canyon, Mt. Whitney Power Co.; Visalia Sub-Station, Mt. Whitney Power Co., 429. Latest Mining and Metallurgical Patents, 431. Working Pit, A. and B. Placer Mine, Josephine Co., Oregon; Close View of Banks in Working Pit, A. and B. Mine, Josephine Co., Oregon; Typical Cross Section Through Block of Ground at Thoss Flat, Josephine Co., Oregon, 432.

EDITORIAL.—Past and Present in Montana, 425. Answering Inquiries on Law Matters; "Mines Are not Made;" A Word About Mining News, Etc.; "Liquid Air Companies;" Progress of Telephone Lines; Understatements and Exaggerations in Mining Matters, 426.

MINING SUMMARY.—434-435-436.

LATEST MARKET REPORTS.—438.

MISCELLANEOUS.—Concentrates, 427. Scrip and the Law of Title to Oil Lands; The Use of the "Baby" Air Drill at the Gold Bank Mine, 428. Mount Whitney, Cal., Electrical Transmission, 429. Amalgamation of Metals, Normal and Electrolytic; Some Recent Additions to the Collection of the California State Mining Bureau, 430. Latest Mining and Metallurgical Patents, 431. Southern Oregon Placer Conditions, 432. Some Observations on Practice of the Cyanide Process at Mercur, Utah; Unaccompanied by Affidavits, 433. Industrial Notes; Personal; Recently Declared Mining Dividends; Books Received; Catalogues Received; Commercial Paragraphs; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 437-438.

IT is with reluctance that a reputable paper ever essays to answer inquiries concerning law matters, naturally propounded by persons vitally interested. Obviously these answers cannot be made with complete understanding of the case, the details and minute attendant circumstances, on which depend accurate acquaintance with the fact, not being usually supplied. As, manifestly, full understanding of such things is needed for intelligent advice it follows that in the absence of such knowledge of the facts any assistance in the matter of explaining individual rights under the law must be necessarily incomplete. Hence this paper's usual advice to consult a competent lawyer, purely as a matter of economy, for, while his fee may seem large, yet, if important interests are involved, it were better to enter or decline to enter into a legal contest fully posted than to take too many chances of loss. What is here said does not apply to ordinary questions of fact concerning the general status of individuals under the law as to ordinary mining requirements.

"MINES are made," was a recent assertion herein, the truth of which is recognized by many who realize that it is easy to locate a claim or find a prospect, but a different and difficult matter to make a mine, and yet that a mine must usually be "made." A good instance of how a mine is thus made is afforded in a recent issue of the Leadville, Colo., Miner, in a notice of the President mine, there, which may be said to be "made," in the sense meant, its maker being the present superintendent, T. Collins. This mine has a daily output of forty tons gold-bearing iron carbonates, carrying from $15 to $25 per ton. The lower grade carries considerable iron, but deducting all charges the ore nets $8 per ton—about $300 per day—nothing big, but a paying proposition. The history of the mine shows a series of expensive efforts by different parties to develop it, culminating in apparent failure six months ago, when Superintendent Collins, who all along had faith in the property, secured a little more money from two local capitalists who shared his faith to the extent of a few thousand dollars, which, judiciously expended, placed the mine on what now appears to be rightly considered as a permanent paying basis. The instance is worthy of mention, for two things: the fact that one man continued, through adverse circumstances and financial stress, to have faith in the property, and in his judgment, staid with it through all, and that, when most needed, two miners with spare money advanced enough to justify his judgment and make a success. Thus a mine was made, instancing the history of a thousand other similar cases.

A Word About "Mining News," Etc.

For forty years this paper has published in each issue two or three pages of reliable mining summary from different mining regions in this west half of America. Some of it is clipped and condensed from local papers, more is furnished by resident correspondents, more still by our traveling representatives; the whole of it is always reliable, impartial, accurate, and as exact as any information of that nature can be. When population was sparse and mines were few; when the prospector had an eye out for Indians and this whole western country didn't have one-tenth the development it now has, this paper was in many cases the only medium of mining news, and the man up the gulch or on the other side of the mountain or down the creek knew little of what was going on ten miles from him till he saw it herein. Now, with nearly every camp connected by rail, telegraph and telephone, the news is more quickly spread, and in this regard the "news" feature of the department referred to is secondary to what it was a generation ago. That is, locally: to the man in Teller Co., Colorado; Calaveras Co., California; Baker Co., Oregon; Silver Bow Co., Montana; or Yavapai Co., Arizona, it is not necessary to wait for the weekly visit of the MINING AND SCIENTIFIC PRESS to see what is done in his own county. He is well served in that regard by communication with his friends and neighbors, and by the efficient local press.

But it is even more important than ever that others should know of what is going on, and in these days of development and investment it is of prime import that the merits and resources of a mining district be shown in the columns of a journal that counts its readers all over the mining world by the thousands, and that is seen everywhere by any one interested in mining.

This is still the province and purpose of the mining news in this paper—not, as in the old days, solely to tell the miner what is going on in his own little surroundings, but to give him reliable, up-to-date condensation of what is done elsewhere; an epitome of all worth knowing in the sales, developments and movements, not alone in his county or State, but elsewhere, and to direct attention to deserving properties.

Such publicity is of recognized value: the knowledge of successful mineral development stimulates interest in a locality, induces investment and improvement to the benefit of all, and in this lies the chief value of the mining news weekly published herein.

That this is generally understood is manifest from the amount of material furnished and the eagerness displayed to secure its insertion; that it is not rightly regarded in some few instances is manifested by the mistaken assumption that this paper is a rival in the matter of competition with local journals. As a matter of fact, the more that appears about a mining locality in this journal the better for the paper or papers printed therein; for such publicity attracts the attention of the investor and brings money and improvement into the district. Time and again a brief paragraph in this paper has been the cause of attracting the attention of investors and the ultimate advancement of the district. Of course, if a community chooses to be churlish or its press decries publicity, preferring insular isolation, such privacy is to be respected; but, ordinarily, a mining community likes to have the world know what they have in the way of mineral wealth.

Then, too, the miner is a good deal of a cosmopolitan, and a great traveler. He rarely remains at home and in twenty years has ofttimes lived in a dozen different places; he can not always afford to subscribe for several papers published in the different localities in which he may be interested, nor has he the time to read them. But he does know that in the MINING AND SCIENTIFIC PRESS he will weekly get a condensation, and accurate reflex of existing conditions in any metal mining region.

What is here said is the result of reading letters from subscribers. It is the pleasure and the privilege of this paper to daily receive criticisms from its readers, some complimentary, others advisory, still others suggestive of what the writers think should or should not be done. And there is no more valuable or appreciated part of these letters that such multitude of friendly suggestion. Some say: "I like your paper and would like it better if you didn't put so damn much technical matter in it." Others suggest that as a technical paper it is just what they want, but express surprise that there is so much space given up to "mere mining news." Many say they read "Concentrates" first of all, and others think that there should be more editorial and less description, but all agree that they "like the paper," and most of our kindly critics commend the mining summary. As one distant reader this week says: "It's always meant to be honest, even if it isn't always exactly correct."

It may surprise a good many thousand readers to have us say that that part of the paper devoted to "Mining Summary" costs us more in every way than any other part of the paper. The character of a paper is sometimes best evinced by the kind of matter that it does not publish.

But while the news feature has not been lost sight of, being greatly improved, the most important element of that department of the paper is not always appreciated. That is its value as a developer. Ordinary "write-ups" at so much or so little a line are not allowed therein. Fulsome puffs of a mine that any intelligent man can see are paid for find no place in these columns. It is generally recognized and understood that if any statement is made in our columns about a mining property it is believed in this office that the information is correct. Hence the confidence universally reposed in the statements of this paper. Herein lies the chief value of the mining news to the mineral interests of this west half of America—not in conveying local information to the local man, but to others, with probability of mutual benefit to far-off readers and local property alike.

The MINING AND SCIENTIFIC PRESS does not assume that it can tell anything about a mine in Amador Co., Cal., that would be news to the superintendent of that mine: what is set down regarding a property in Tooele Co., Utah, is known and understood better by a man in Mercur than by one living in Boston or London: to attempt to tell the foreman or owner of a property in Summit or San Miguel county, Colorado, any news about the property he is developing would be useless, for he knows more about the mine in five minutes than any paper could tell in five weeks; but the question is not how much he knows about his property—that is, of course, important—but from a development or investment point of view it is vastly more important that others outside should know of it. That is where the greatest value to a mining section lies in the publication of mining news concerning it in this paper; not in telling one big man or one small community what the man or community know better than any paper can tell them, but in giving accurate information to the great outside mining world; to men with capital who don't care three straws whether the big man's name is Smith or Jones, or the little community is called Smithville or Jonestown, but who may possibly be interested in a correct statement in a reliable paper regarding possible profitable investment.

UNWORTHY of serious attention are the current advertisements of "liquid air companies," and the absurd claims made regarding reduction of cost of generating power, refrigeration, etc., thereby are too transparent to fool any one except the grossly credulous. Liquid air has not yet reached that stage where its commercial value is generally applicable in an economic way, and any one taking stock in some of the companies advertised can choose between that form of investment and buying bogus lottery tickets.

TELEPHONE LINES throughout California and eastward are now in such state of progress that it is reasonably expected that by this time next year one can speak into a receiver at San Francisco and be heard in New York City. To European readers who do not always grasp the magnitude of distances on this continent, it may be said that from San Francisco to New York is about the same distance as from London to Astrachan.

IN mining matters the force of understatement is as strong as exaggeration is weak. To say the ledge is 5 feet wide and the ore averages $7.50 when, as a matter of fact, it is 6 feet wide and averages $9, appeals more favorably to the prospective bonder or buyer than to assert that the ledge is 12 feet wide and that the ore clear across averages $18—and fail to prove it.

Concentrates.

BOOKS on mining and metallurgy are free of import duty.

MACDONALD'S "Skeleton Mining Report" is out of print, and can no longer be furnished.

ON Jan. 31st, 1900, the State of Washington had 683 stamps, of which 550 were in operation.

A PLACER LOCATION can be any shape, but an individual location can not exceed twenty acres in area.

A WOMAN, married or single, can locate and hold a mining claim by due observance of legal requirements.

"TEMPERATURE OF BATTERY WATER" was fully discussed in a practical article in the issue of Nov. 19, '98.

MACHINERY on a mining claim is part of the freehold, and, as such, title therein passes to the legal relocator of the claim.

THE buoyancy of a vacuum is about 537 grains per cubic foot. It varies with the temperature and barometric pressure.

AT sea level the atmospheric pressure on 10 square feet of the earth's surface is 10,584 tons; on ten square miles, 295,064,947 tons.

FULL detailed technical account of how to start a lead blast furnace, written by a past grand master in the art, appeared in the issue of May 21, 1898.

ALL waters act on copper. "Hard" water takes up little lead from lead pipes; "soft" water and carbonated water dissolves out considerable quantities.

MOLYBDENITE is of value in the East in the manufacture of steel. The pure concentrated mineral has a present market value in Pittsburg of $200 per ton.

A YARD of pipe will hold about as many pounds of water as the square of its diameter in inches: thus a 4-inch pipe would hold about sixteen pounds of water in each 3 feet of its length.

THE measure of actual damages for false representations in the sale of goods, which the buyer has received and paid for, is the difference between the price paid and the value of the goods.

THE specific gravity of pure iron is 7.844. Pure iron is rarely seen and is a chemical curiosity; it is white with a brilliant luster. Ordinary merchantable iron has a specific gravity of about 7.8.

WHERE the mean pressure on the piston of a steam engine is equal to eight tons, and the velocity of the piston is equal to 250 feet per minute, the theoretical horse power of that engine is 121.21.

AS IN California, gold is found in slate in North Carolina. The same general origin is ascribed to the gold formation in both cases—the ascension of mineral-bearing waters from solfataric depths.

LOCAL Michigan papers say that the Calumet & Hecla Co. is losing about $\frac{1}{10}$ of 1% of copper in the tailings, or $1,200,000 per annum. Osceola's loss is thus given at about $\frac{8}{100}$ of 1%, Quincy's $\frac{8}{10}$ of 1%.

THE latent heat of fusion of gold is 16.3 calories. In the case of most metals the latent heat of fusion is about one-third the heat required to raise the metal from absolute zero—273° C.—to its melting point.

TIN PLATE is a sheet of iron or steel coated with tin. Terne plate is a sheet of iron or steel coated with an alloy of tin and lead, in proportion of about 20 to 80, respectively. Terne plates are usually for roofing.

A COMMON CARRIER who used due and reasonable diligence in delivering a shipment is not liable to the consignee for the expenses incurred by him in going to the station to receive the same before its actual arrival.

HYDRAULIC MINERS have a theory, more or less borne out by experience, that when a gold-bearing stream forks into two or more branches the source of the gold is more often found in the right hand branch.

THE 5-cent coin in use contains 25% nickel, 75% copper. Nickel, more than any other metal, has the property of giving color to an alloy. Even an alloy of 90% copper and 10% nickel will have the peculiar nickel tint.

TONGSHAN, CHINA, is eighty miles from Tientsin. The Chinese Government has there established a factory of railway rolling stock. From the mines in the vicinity the Chinese engineering and mining company daily mine 2000 tons coal.

MOTOR manufacturers figure that a stream from which, by dam and piping, one can get forty to fifty gallons of water a minute at 10 to 20 feet of head and fall, can energize a motor that will give power equivalent to the power of two men.

TO RUN a dynamo, of whatever make, the commutator cylinder must be turned away from the ends of the brushes if copper ones are used. If carbon brushes are employed, it can be run either way, but proper lead must be given the brushes.

TO DRILL chilled iron take bicarbonate of soda, one-half ounce; bicarbonate of potash, one-half ounce; cyanide of potassium, two ounces; pulverize and mix; heat the drill bit to a light cherry red and apply power enough to look gray; cool in water.

A MAN or minor or corporation can legally hold 100 unpatented mining claims if sufficient work or improvement be annually done on or for each claim to comply with all legal requirements. The way to deal with the "claim hog" is to make him strictly comply with such requirements, or let go.

COLORADO sometimes assesses unpatented, unproductive claims at $500 each: California, usually, at $100 each, for taxation purposes. The figure of assessment on a producing property varies with the amount of common sense possessed by the county assessor.

SINCE the Southern Pacific Co. acquired the Carson & Colorado railroad the ore rate has been advanced from $6, the former charge, to $10 per ton, and the shippers who thought the old road charged too much now tell regretfully of old times, "when things were right."

THAT there is tin in California, Colorado and South Dakota is an established fact, but so far it has not been found in any one of the three States in sufficient quantity to be of commercial importance. Tin has been profitably mined in Tasmania for twenty-five years.

REGARDING the suggestion as to the order of drop in a 10-stamp mill in the issue of March 4, '99, a South Dakota correspondent thinks that 1-7-3-9-5-2-8-4-10-6 is a better arrangement, claiming that this order precludes possibility of the pulp accumulating at one end.

WITH a 4-inch drop a stamp occupies .154 of a second in dropping; with a 6-inch drop, .19 sec.; 9-inch, .233 sec. With a cam lift of 7 inches, ninety drops per minute, the time of lift and drop is .667 second; .297 sec. for the lift, .164 sec. for the rest, and .206 sec. for the drop.

IT is thought by millmen that a slight hollowing of the shoe helps the crushing capacity of the stamp, by tending to hold the pulp under the stamp instead of splashing it out. Irregular cupping is not considered, but an even, gentle hollowing out of the face of the shoe.

GLYCERINE used by powder manufacturers now commands 13 cents per pound. At ruling rates for the manufactured product that means an average profit to the powder manufacturer of about 25 cents per case. Glycerine at 10 cents—the former price—would admit of a profit of about 50 cents per case.

IT has been decided by the Supreme Court of the State of California—Morse vs. De Adro, 40 Pacific Reports, 1018,—that the statute securing a lien on mining claims for labor performed thereon does not authorize a lien for labor in working a mine or lands held under an agricultural patent from the United States.

AFTER issuance of a U. S. patent to a placer claim any lode thereon goes with the patent and can not be made the subject of any adverse action. If the lode be discovered within the limits of the placer location before issuance of such patent it may be located, and so far as it is concerned the placer location would have to yield to it.

A SLIME TABLE may be considered as an improved buddle. Its advantages are continuity of action, ability to deliver a finished, a middle and a waste product, requiring little technical attention, low requirement of power, and ability to handle pulp containing considerable water, as usually the case with battery or fine jig tailings.

"GABBRO" is a granular intrusive rock, consisting, principally, of diallage or allied monoclinic pyroxene, or rhombic pyroxene, together with soda lime and lime feldspars. "Gabbro-diorite" is a term indicating areas of gabbro containing primary and secondary hornblende and areas containing intimate mixtures of gabbro and diorite.

WHOEVER takes a check upon a bank in his own town should present it for payment on the day he receives it or on the next day. During these two days the drawer of the check guarantees the solvency of the bank upon which it is drawn; but after that the risk must be borne by the check holder. This is the rule enforced by the courts of all the States.

THERE are but two Government institutions authorized to receive ores for assay, one at Deadwood, S. D., and the United States Assay Office at Charlotte, N. C. It is not the policy of the Government to enter into competition with private assayers, therefore the charges at those Government institutions are fixed at $3 for gold and silver; other metals the same.

AT any time prior to the issue of the receiver's receipt, in patent proceedings for a mill site, should mineral be discovered within the located boundaries of such mill site in sufficient quantity to justify exploitation, a valid mining claim can be located thereon, if in good faith and for bona fide mining purposes, regardless of whether the mill site has or has not been abandoned.

THE specific gravity of a body is slightly altered when enveloped in compressed air. Any increase of density in the air slightly decreases the specific gravity. Air at mean temperature is nearly 800 times lighter than water; at fifteen pounds excess of air pressure its density would be doubled, and a body should have less specific gravity by $\frac{1}{800}$ of its value in the compressed air.

EXTENSIVE tunnel projects are not counseled by mining engineers in a non-fissure country, or where irregular deposits of blanket veins exist; nor in tellurium-bearing regions, owing to the possibility of tellurium ores changing at great depths to a worthless form of sulphide. In a fissure region, where sulphide ores predominate, as in parts of Colorado, the tunnel method is deservedly favored.

ONE may do annual assessment work on an unpatented mining claim for ten or any number of years, and yet the claim is subject to relocation if the required work is not so done for any calendar year. The idea of the annual assessment work is to keep the claim from lapsing, but without application for patent $10,000 in work and improvements would not hold a claim without working it.

PHOSPHATE is produced mainly in Tennessee and Florida. The total production of all phosphates in Florida in 1899 was 796,691 tons. Seventy per cent of the Florida phosphate rock is exported to foreign countries, notably to Great Britain and Germany In January, 1900, quotations were $8.50 to $9 per long ton at Fernandina, Fla., and $13.13 to $13.83 in British or North Sea ports.

IF 3% of acetylene be mixed with air, an explosive mixture is produced. In the case of hydrogen 5% is required, and for coal gas 8%. If gaseous acetylene under a pressure of two atmospheres or over be ignited by a spark it will explode without the presence of air, the violence of the explosion being proportional to the pressure. Its storage under pressure is a matter of extreme danger.

AN open circuit battery is one adapted for occasional or intermittent work only. Such a battery must be inactive when the circuit is open, and must have the property of depolarizing itself so as to be ready for use when needed. It may be very quickly polarized in use without detracting from its availability. A closed circuit battery must not be easily polarized in use, and may, and often does, polarize when not used.

WHEN molten lead is exposed, at high temperatures, to the action of a current of sulphur dioxide, both lead sulphide and lead dioxide are found in the product. On heating a mixture of lead sulphide and lead sulphate in a vacuum a reaction occurs, having sulphur dioxide as one of the products; the amount of residual lead sulphide and oxide being dependent on the temperature and the duration of the experiment.

BY a "unit of heat" is meant the heat that will raise the temperature of one pound of water 1°. At a temperature of 60° F., it would take 19.64 pounds of water to condense one pound of steam, the temperature of the resulting water being 120° F. A cubic foot of water at 70° F. contains 41,995.2 heat units. The chief aim of a modern steam raiser is to make as much of the surface of the boiler as possible absorb heat instead of radiating it.

PETROLEUM is the ideal smokeless fuel. It is also of economic value. One pound of petroleum will evaporate 18½ pounds of water at 212° F., or twice as much as the average evaporation obtained from coal in ordinary practice. With Pennsylvania petroleum 75% is capable of being made into refined oil, leaving 25% residues; with Russian petroleum the figures are exactly reversed, 25% made into refined oil, 75% residues. It is these latter that are burned. They have a fire test of 330°.

THERE can not be correctly applied such a term as a "copper placer mine," as the word "placer" implies a broken formation washed and deposited in the course of a stream. In Salt Lake county, Utah, and in one or two instances in Montana, what are called "copper placers" have been found, but the copper so procured has been demonstrated to be the result of copper in solution coming in contact with masses of carbon formed by decayed timber in the soil, which has precipitated the copper in a metallic form.

SO FAR as the mechanical question of pumping and hoisting goes, there is no insuperable difficulty in contemplation of successful mining at a depth of 10,000 feet, but it is believed that must be considered the limit of deep mining. The suggestion that mining may be possible "at a depth of 20,000 feet" seems unaccompanied by the reflection that the air at such depths would have such compression by reason of its own weight that a temperature of 60° F. at the mouth of the shaft would approximate 300° F. at the bottom.

LOSS of mercury should not ordinarily exceed 0.03 pound per ton of ore. Mercury should be fed to a quantity of about three times the weight of gold assumed to be in the ore. When inside amalgamation is taking place the mercury should be fed at regular intervals—say, every 2½ hours—into the mortar box. One way of feeding is with a wooden measure holding about one-half ounce, dipped in a bottle, closely stoppered, holding three to five pounds, drawn from the purifying mercury tank, and adding a little sodium amalgam, a piece the size of a pea, to every pound.

ORDINARILY a quartz vein of gold ore is a body of quartz occupying the entire width of the fissure from wall to wall, the ore body being either of relatively narrow extent in the center, or distributed in still narrower stringers through the quartz. In such veins "ore shoots" may be considered as long and more or less continuous patches or bodies of ore descending and following the downward dip of the vein, these often separated from one another by comparatively barren intervals, but all with a uniform direction of dip. These ore shoots are of varying length to 1000 feet.

CENTIGRADE is the simplest and best graduated thermometer. Fahrenheit continues in common use from popular inertia. An easy rule for converting Fahrenheit to Centigrade degrees, is: Subtract 32 degrees and divide by 2; then add to this $\frac{1}{10}$ of itself, and, if further accuracy is desired, $\frac{1}{100}$ more. For instance, if it is required to find the number of Centigrade degrees corresponding to 72 degrees Fahrenheit, subtract 32 and divide by 2, giving 20; adding $\frac{1}{10}$ more gives 22, and, for greater accuracy, another $\frac{1}{100}$ gives 22.2. The method is not as simple when applied to the reverse calculation.

Scrip and Law of Title to Oil Lands.

NUMBER III.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by A. H. RICKETTS.

The term "placer" appears to be used in the United States mining law as understood by miners and includes all forms of mineral deposits, excepting veins of quartz or other rock in place; this includes asphalt, gypsum, natural gas, petroleum and other non-metallic minerals. Instances of metallic mineral placer claims are those containing gold, tin and platinum gravels, iron, manganese and aluminum.

In a legal sense a placer location may contain any one or, say, all of these minerals. Frequently such a claim contains a "known vein," in which case such vein is subject to independent location; or veins not disclosed upon the surface may be found therein, in which case they are the property of the placer claimant. Hence, generally speaking, any unstratified or isolated mineral deposit within or upon the surface of a placer claim is sufficient for the purposes of a valid location and the right of the claimant is not restricted to any one of these. To illustrate: A claim located for and as a petroleum placer claim, and so stated in the notice of location thereof, but lacking actual discovery of ore therein, can be held for the deposits of gypsum, etc., it may contain. Unless required by some local rule or custom, it is not necessary to designate the character of the deposit inducing the placer location.

In his recent work entitled "Genesis of Petroleum and Asphaltum," State Mineralogist Cooper says, "Surface indications of the presence of petroleum consist of unaltered rocks, white-leached shales and sandstones, shales burnt to redness, fumaroles, mineral springs and the residue from mineral springs, such as selenite, etc., subsidences, natural gas, springs of petroleum oil and maltha, porous rocks saturated with bitumen, cracks in shale and other rocks filled or partly filled with bitumen, black silicified shales. * * * * * Outcrops and anticlines can be followed from outside property into the property being examined and the structure being considered sufficiently well demonstrated so as to justify a person in drilling wells for oil, even if bitumen were absent from the surface of the land upon which the well is to be drilled and the exposures of the strata are but slight."

But, under the law as it is administered by the land department, a claim located as a petroleum placer claim containing nothing more than such indications (which do not prove the existence of petroleum oil itself) would not be considered a valid claim, but subject the land claimed as such to agricultural entry as the land department insists that it must be profitably worked before it can assume the character of mineral land; that is, that a producing oil well must be situated within the limits of the ground claimed as a petroleum placer claim. How very far the land department carries that rule is shown in the following extract from one of its rulings, which by analogy applies to an oil claim, viz.: "The report of a deputy mineral surveyor upon land applied for as placer ground, that the soil was of sandy character, composed of disintegrated granite; that the mineral value of the land had not yet been proven, but that it was believed to be equal to that of the many other tracts which have been extensively worked in the district; that the ground was of no value for agriculture, townsites or timber; that there existed no workings thereon; that the surface was underlaid by a deep bed of gravel bearing placer gold, does not establish the mineral character of the land, as the existence of mineral as a present fact must be shown."

The following language from the opinion of Judge Ross in the case of the Nevada Sierra Oil Company v. Home Oil Company, decided last December, is apposite. That learned judge says: "But there were nothing more than the indications of existing oil under the surface of the ground in question, which might or might not prove to be true. Mere indications, however strong, are not, in my opinion, sufficient to answer the requirements of the statute, which requires, as one of the essential conditions to the making of a valid location of unappropriated public land of the United States under the mining laws, a discovery of mineral within the limits of the claim. Rev. Stats., Secs. 2320–2329, Waterloo Mg. Co. v. Doe (C. C.), 56 Fed., 685. Indications of the existence of a thing is not the thing itself. It is entirely true that the statute requiring as a condition to a valid location the discovery of mineral within the limits of the claim should, as between conflicting claimants to mineral lands, receive a broad and liberal construction, and so as to protect bona fide locators who have really made a discovery of mineral, whether it be under the statute providing for the location of vein or lode claims or placer claims. As was well said by Judge Hawley in Book v. Mining Co. (C. C.), 58 Fed., 106, 120, in speaking of vein and lode claims: 'When the locator finds rock in place containing mineral he has made a discovery, within the meaning of the statute, whether the rock or earth is rich or poor, whether it assays high or low. It is the finding of the mineral in the rock in place, as distinguished from float rock, that constitutes the discovery and warrants the prospector in making a location of a mining claim.' So, in respect to placer claims, if a competent locator actually finds upon unappropriated land petroleum or other mineral in or upon the ground, and so situated as to constitute a part of it, it is a sufficient discovery, within the meaning of the statute, to justify a location under the law, without waiting to ascertain by exploration whether the ground contains the mineral in sufficient quantities to pay. The question whether a particular piece of the public land is more valuable for mineral than for agricultural purposes is one that does not arise in cases like the present, which was one between parties who both claimed the land as mineral land. The question there was which of them had first made a valid location of the ground in controversy. While, as has been said, the statute requiring a discovery of mineral as one of the essential conditions of a valid location of land under the mining laws should be liberally construed in behalf of bona fide locators, no court would be justified in ignoring the statutory requirement. Mere indications of mineral, I repeat, do not constitute the discovery of the mineral itself. If so, a location made upon the discovery of such indications, followed by the proper marking of the boundaries of the claim and the doing of the statutory amount of work within the prescribed time, whether the work resulted in the actual discovery of mineral or not, would entitle the locator to apply for, and, upon due proof and payment, receive, the Government title to the land as mineral lands; which obviously would not only be unauthorized by any provision of the statute, but would be in direct conflict with the sections already cited." The authorities, however, are not harmonious upon the point that indications of mineral are not sufficient to warrant a location.

As said by the Circuit Court of Appeals for the Eighth Circuit in a recent case: "The Acts of Congress prescribed two, and only two, prerequisites to the vesting in a competent locator of the complete possessory title to a lode mining claim. (And the same rule is by the statute made applicable to placer mining claims.) They are the discovery upon unappropriated public land of the United States, within the limits of his claim, of a mineral-bearing lode, and the distinct marking of the boundaries of his claim, so that they can be readily traced. No appropriation of the land is made until both these requirements are fulfilled, and until that time the lode and land sought are open to location and appropriation by any competent locator; but, when these requirements have been complied with, the land is no longer public, but the possession, the right to the possession, and the right to acquire the title are irrevocably vested in the locator."

The Court proceeded to hold that, in the absence of any intervening rights, it is immaterial that the discovery is not made until after the posting of the notice and the marking of the boundaries of the claim, saying that the order in which the statutory requirements are complied with is immaterial so long as the rights of others do not intervene before they are complied with; that the marking of the boundaries of the claim may precede the marking; and, if both are completed before the rights of others intervene, the earlier act will inure to the benefit of the locator as of the date of the later, and a complete possessory "title to the premises will vest in him as of the later date," provided that the laws of the State or Territory and the local rules, regulations and customs of the miners of the district in which the claim may be situated are fully complied with as to all Acts concerning the locating and holding of the claim. Thereafter until patent issues the right to the claim is preserved from forfeiture by proper representation.

In the Home oil case above cited Judge Ross further says: "It is true that upon mineral land of the United States upon which there is no valid existing location any competent locator may enter, even if it is in the actual possession of another, provided he can do so peaceably and in good faith, in order to initiate a location for himself; but no right upon any Government land, whether mineral or agricultural, which is in actual possession of another, can be initiated by a forcible, fraudulent, surreptitious or clandestine entry thereon. Such entry must be open and above-board, and made in good faith. One who is in the actual possession of a mining claim, working it for the mineral it contains, and claiming it under the laws of the United States, whether the location under which he so claims is valid or invalid, can not be forcibly, surreptitiously, clandestinely, or otherwise fraudulently intruded upon or ousted while he is asleep in his cabin or temporarily absent from his claim."

But this doctrine is of but little avail to the average claimant of an unpatented mining claim, as he usually holds his claim by constructive, not actual, possession. It certainly gives no comfort to the large number of oil miners whose claims have been selected as agricultural land under the Forest Reserve law. They are compelled to show that the same, as a present fact, are more valuable for mining than for agriculture, although existing conditions show the ground to be absolutely valueless for the latter purpose. The absence of agricultural possibilities gives no strength to mineral probabilities and the good faith of the "scripper" is not considered material to the issue.

In the opinion of the writer, lands claimed as petroleum oil land, and which present such indications of the existence of that or other mineral oils that the claimant is willing to spend his time and money in exploring it in the expectation of finding such fluid minerals in paying quantity supported by expert testimony, showing that the land contains such indications as to make it likely that petroleum or other mineral oils will be found therein in paying quantities: or the fact that neighboring territory is producing oil and that the geological conditions warrant the conclusion that the oil stratum underlies the ground sought to be appropriated by the mineral claimant should be sufficient basis for a valid petroleum placer location or to withdraw such land from agricultural entry at least for a reasonable length of time, during which exploratory work should be prosecuted with reasonable diligence, or the claim be forfeited. But that is not the law, and nothing short of congressional legislation will make such conditions possible.

The Use of the "Baby" Air Drill at the Gold Bank Mine.*

Written for the MINING AND SCIENTIFIC PRESS by H. P. STOW.

In August, '98, the Compressed Air Machinery Co., 11–13 First St., San Francisco, Cal., made me a small drill on the same general principles of their larger or giant drill, the drill weighing about 100 pounds. The first drill was delivered the last of that month, the diameter of the cylinder being 2¼ inches, their larger drill in use at this mine being 3½ inches. The drill was tested through the month of November with satisfactory results, being used principally in the stopes, though it was tried in drifts and raises. I ordered four more drills of the same size, advising strengthening of various parts that experience had shown were weak, and on the first of the year '99 introduced them throughout the mine to do the stoping, with the result of reducing the payroll an average of $1500 a month. All the work is now done by the air drills, the baby drills doing all the stoping, and occasionally being used to run raises. They have been used with success in a drift where the formation was not too hard. I am at present using a baby drill to widen down the shaft, the shaft being originally an upraise from a crosscut tunnel. Most of the rock is hard greenstone, the small drill being strong enough to stand the work.

The drills as now made weigh about 105 pounds and are easily handled by one man, and as a rule the miners require no help in rigging up and getting ready to run. It frequently happens that a miner is sent from one part of the mine to another to change his place of drilling, and he shoulders his machine, takes his wrenches, etc., in his hand and moves about without any help from others, illustrating the ease and facility with which the machines can be used underground.

The mine does not run but six days in the week, while the mill (forty stamps) runs seven. The mill crushes an average of 3200 tons a month of hard quartz. I consider the quartz above the average in hardness. The stamps weigh 1000 pounds, drop 103 a minute, discharge through a No. 7 slot punched screen with low discharge, there being no inside coppers in the mortars. Four baby drills running day and night supply the mill with quartz. Of the average of 3200 tons a month, 580 were broken by the larger machines, leaving an average of 327½ tons a month, one shift a day, to the baby drills.

We always supply water to the miners under a pressure, running a water pipe wherever we run an air pipe, the work done by the drills and the time saved by the men being deemed to more than compensate for the extra expense. We used water here when we had to pump it out of the mine and know it is economy. We run our drills under an average pressure of eighty-five pounds. We use ⅞-steel for the short drills and ¾ for the long ones. Experience has taught us that the air required to run a 3½-inch drill under 85 pounds pressure will run three and a half baby drills. It may be of interest to know that the original baby drill is still in operation in this mine.

Forbestown, Cal.

See illustrations on front page.

THE publisher of any journal no doubt loses something whenever another paper enters the field which he covers; but if he loses something, his patrons and the interests he represents lose more. To secure a few advertisers, write a few general articles and issue a paper is one thing; to maintain steadily from year to year a policy of helpfulness, to write intelligently on technical questions and to secure a position where a publication is accepted as authority is not the work of one year, but of many years. No doubt a local pride misleads men in many ways, but in nothing is it more evident than in the trade newspaper line. A trade paper can not be local and live. It can not be a boomer of any locality and thrive. It must represent an industry and not a place.

Mount Whitney, Cal., Electrical Transmission.

Written for the MINING AND SCIENTIFIC PRESS by H. G. PARSONS.

The Mount Whitney, Cal., Power Company, headquarters at Visalia, Tulare county, Cal., is one of the latest of the extensive California electrical enterprises. The company began furnishing power to patrons July 1, 1899.

The water is diverted from the Kaweah river at Oak Flat, 45 miles east of Visalia, at an elevation of 2400 feet. The water for power purposes is taken through a tunnel, 47 feet long, through solid rock. The tunnel exit, where the wooden flume begins, is above the river and out of danger from high water. The entrance to the tunnel is at right angles to the river.

The flume is built over a rough, mountainous country; for 30,000 feet it meanders along the steep mountain side, in places over granite boulders and smooth bluffs, or along perpendicular cliffs, where points for its foundation timbers were blasted out of the solid rock. The flume has a uniform grade of 1 foot in 200—26.4 per mile—is constructed of redwood boards 1½ inches thick, is 3 feet wide and 2 feet deep, rests on 4x4 sills, spaced 4 feet apart, and is enclosed by posts and caps of 2x4 set at each sill. The cracks in the flume are covered with battens 4 inches wide and 1 inch thick, nailed on the inside. Here and there trestles are required to support the flume across ravines and rocky places. At intervals sand boxes and waste gates have been provided, so that any sand which might find its way into the flume can be disposed of before reaching the pipe. The carrying capacity of the flume is in excess of present needs.

The flume terminates in a sand box and overflow gate, at right angles to which an apron leads off to the penstock. The latter is 6x8 feet and 16 feet deep.

From the penstock a pipe line extends 3300 feet to the power house, making a perpendicular descent of 1300 feet in that distance. The pipe line is buried in a deep trench most of the way, particularly the lower 2000 feet. Starting at the penstock, the pipe is 50 inches in diameter, tapering to 24 inches in the first 50 feet. Then follows 2140 feet of riveted pipe, beginning with 24 inches inside diameter and tapering to 20 inches diameter. Then comes welded pipe, beginning with 20 inches inside diameter and tapering to 20 inches diameter. The thickness of steel in the pipe increases with the pressure it has to withstand. The riveted pipe begins with No. 12 gauge and increases to No. 1 gauge; the welded pipe begins with steel $\frac{5}{16}$-inch thick and increases to steel ½-inch thick. The welded pipe was put together with "bumped" joints instead of flanges. Four hundred feet from the power house the pipe, all but the joints, was embedded in concrete; at other points, especially where angles were made, or where the hillside was unusually steep, the pipe was fastened to the granite bedrock by iron bands and turn buckle rods. The pipe has six air valves in the first 1000 feet from the penstock.

The pressure registered at the nozzle in the power house is 565 pounds per square inch. Water issues from the waste nozzle in a stream as solid as a bar of iron, traveling at a velocity of over 17,000 feet per minute.

The power house stands parallel with the pipe line; the water is led to the wheels through passages of gradually decreasing area, so that the increase in velocity is uniform until the water issues from the tip of the nozzle. The gates which close the nozzles are of special design for the great pressure to be withstood, and are operated by means of large hand wheels through the medium of a worm gear. When the gates are open, a cylindrical aperture is always presented for the passage of the water. The water which is deflected downward by the cut-off device into the tailrace is received upon heavy cast-iron baffle plates and thence conveyed to the river.

The water wheels are mounted directly upon the shafts of the generators overhanging the bearings. They are solid steel castings, machine finished, weigh 1400 pounds each, with twenty bronze buckets bolted to each wheel. They are 50 inches in diameter. There is one nozzle to each wheel, equipped with a special cut-off hood, operated from a stand at the switchboard, so that the amount of water supplied to the wheel is at all times under the control of the switchboard attendant.

The electrical equipment consists of three Westinghouse kodak type three-phase alternating current generators, separately excited, slotted type continuous winding armature, 450 K. W. each, amperes 1020, volts 440, alternations 7200; speed 515 revolutions per minute. The water wheels are mounted on one end of an extended shaft having two bearings, a 4000-pound cast-steel flywheel on the other end, also a driving pulley for the exciter. The three generators gave a normal capacity of 1800 H. P. There are two belt-driven, direct-current generators of 15 K. W. each for exciters; speed, 1050 revolutions per minute; volts, 125. Each exciter has capacity to excite the three generators, and is so located that it can be driven from either generator nearest to it.

The switchboard consists of five marble panels, all 2 inches thick, 65 inches high and 24 inches wide, mounted on an iron frame. There is one exciter panel, three generator panels and one distributing panel, each equipped with approved modern appliances. From the generator and exciters all wires and cables are run under the floor in conduits to the switchboard, and from there in the same manner to the raising transformers. There are four raising transformers of 500 K. W. capacity each, oil-insulated, air-cooled. These are three-phase transformers, primary voltage 440, secondary 17,000 volts with coils in parallel, or 34,000 volts with coils in series. The secondary wires lead from the top of the transformers to the addition on the side of the power house, where the high-tension switches are arranged. The high-voltage current is then conducted to the lightning arrester house, located 25 feet from the power house. This building contains three lightning arrester units, each consisting of six choke coils in series with the line and thirty arresters mounted on a marble slab. Thence the current is delivered to the transmission line, consisting of three medium copper wires, No. 2 B. & S. gauge, arranged in the form of an equilateral triangle, one wire being mounted on the top of the pole and the other two on a crossbeam of 3x4 Oregon pine, boiled in oil.

About 21 miles from the power house the line is branched, one line going southerly through Exeter and Lindsay to Porterville, the other going westerly to Visalia and thence to Tulare. The distance from the power house to Porterville is 43 miles, to Visalia 29 miles and to Tulare 40 miles. The pole line is equipped with cross-

Visalia Sub-Station, Mt. Whitney Power Co.

beams below the power circuit for telephone purposes, the Sunset Company having a contract for the use of the poles for this purpose.

Sub-stations are established at Visalia, Tulare, Exeter, Lindsay and Porterville, where the high-voltage current is received, and, by means of lowering transformers, is changed from a three-phase to a two-phase current of 2000 volts for distribution for light and power. The incandescent lighting circuits are supplied direct from the 2000-volt distribution and pole transformers to 104-volt secondaries. At present the power used at the different towns is as follows: Visalia, 344 H. P., 200 of which is for the Gas, Light & Heat Co., 50 for the water works and 30 for ice plant; Tulare, 90 H. P., 50 of which is for water works; Lindsay, 195 H. P., mainly for pumping plants and private lighting; Porterville, 105 H. P., 35 of which is for electric light works, 70 for Pioneer Co. and hotel. The price for 1 H. P. per annum is $50. Robert McF. Doble is consulting engineer.

Amalgamation of Metals, Normal and Electrolytic.

Written for the MINING AND SCIENTIFIC PRESS by J. H. JORY.

Events at Cape Nome within the past year have drawn new attention to the old subject of amalgamation. When the beach diggings were discovered at that place, it was found that though the sands contained gold in large quantities, yet the metal existed in such fine particles that to save any large percentage recourse must be had to amalgamation.

Plates were at once in demand. Copper was torn from the bottoms of wash boilers and other articles of culinary use, and old copper junk of every kind commanded fabulous prices. In lack of copper, tin plate and galvanized iron were used and some of the more opulent individuals covered the bottoms of their rockers with silver dollars on which to spread the mercury to amalgamate the gold. The subject of amalgamation being one of importance, and recent developments having lent it a new interest, there may be occasion for the presentation of some facts in connection therewith, for though there are many things concerning amalgamation which are generally well known, there are others with which even well-informed miners are totally unacquainted.

The process of amalgamation, as used in the extraction of gold and silver, was probably first used by the miners of Spain and was introduced by the Spanish into America at an early date. It is merely a modification of the more ancient method of coating inferior metals with gold, known as "fire-gilding." In this process the article to be gilded is amalgamated with a combination of gold and mercury, which, on the latter metal having been volatilized by heat, leaves the surface manipulated beautifully gilded.

Most of the metals are subject to amalgamation in a greater or lesser degree, but only two or three of these are useful for the purpose of saving gold by this process.

Gold has probably the greatest alloying affinity for mercury of all the metals, and being also the least subject to corrosion by water or gases it would stand first as an amalgamating medium were it not for its great cost.

Silver and copper have been found the most useful and practical metals for this purpose. The latter metal is readily amalgamated, but is subject to corrosion from atmospheric influences and from minerals or gases contained in the waters used. The oxides or carbonates so produced, flowing over the mercury employed, prevents its contact with the gold particles and makes amalgamation impossible; hence the necessity of silver plating. Many of the old copper plates used in the mills, however, have become so impregnated with the gold amalgam of years as to be a sort of fire-gilded and in this condition are superior to any silver plate that can be produced; for silver, itself, though admirably adapted for amalgamating purposes, is inferior to gold in that it is liable to be attacked by sulphurous gases.

Quicksilver dissolves several of the metals, in a greater or lesser degree, while entering into the combination known as amalgamation. A small quantity only of gold, silver or copper enters into solution, but some of the other metals, among which are tin and lead, are almost entirely dissolved, and when these metals have combined with mercury it is very difficult to restore the latter to its original, useful purity. Under normal conditions nickel and iron are extremely difficult to amalgamate, and the condition is of little value when it has been obtained. Zinc is easily subject to amalgamation, but the basic carbonate soon rises to the surface and destroys its usefulness as a medium of presenting mercury to its affinity for gold. In the form of galvanized iron it becomes disintegrated in a short time when alloyed with mercury, and strips from the iron that has been coated by it. Tin plate is also soon destroyed by the application of mercury, as the coating of tin becomes dissolved and leaves the iron bare as an entirely useless surface. Attempts have been made to substitute German silver and other so-called "white metals" for silver plates, but as these alloys present the same difficulties as the metals of which they are composed nothing is gained by their use, except that, when sheets of these alloys may be obtained cheaper than copper, they may serve as a substitute for that metal as a basis for silver plating.

Some one, ignorant of its peculiar properties, has advised the use of aluminum as an amalgamating plate.

This metal, however, though not acted on by strong nitric or sulphuric acids, presents the most remarkable phenomena of all mercurial reactions in its great chemical affinity for quicksilver.

A sheet of aluminum rubbed with a little pumice and mercury becomes at once amalgamated; but in a few moments a most intense chemical reaction sets in. Great heat is evolved and the surface of the plate becomes rapidly covered with a thick efflorescence of a substance—in appearance and gravity—resembling wood ashes. This reaction can scarcely be checked by any means until the whole of the mercury has combined with the aluminum or the plate has become perforated.

In practical work, therefore, only two metallic surfaces are available for the purposes of amalgamation, viz., silver and copper; and as both these metals are liable to disturbing influences, constant attention to the keeping of the surfaces clean and bright is essential to successful amalgamation.

In this connection the manner of dressing the plates becomes of importance. Many amalgamators resort to such drastic measures in cleaning the plates that there is a constant occurring reaction, which not only gives much trouble, but also occasions loss. Mineral acids or sal ammoniac should never be used for this purpose except under extreme circumstances. Citric, tartaric, oxalic or other vegetable acids are generally strong enough to dissolve the oxides or carbonates derived from the copper or any sulphide that may discolor the silver. But better than either of the above is a weak solution of potassium cyanide, which not only dissolves the oxides, but also removes any slight coating of grease that may be present.

Amalgamation is only possible on clean metallic surfaces. This applies not only to the plates, but also to the particles of gold or silver that are to be deposited.

Grease, sulphuretted hydrogen, and other elements in the water may prevent amalgamation, as also may talc, graphite, lead, and other minerals associated with the sands. The gold itself is often covered with films of mineral substances, such as the alkaline silicates, and the oxides and sulphides of iron and copper, and is then said to be "rusty." At places near the seashore, and in other places where common salt exists, there is found on the placer gold another kind of coating which is produced by a combination of gold and metallic sodium, which forms a discolored, indurated surface and renders amalgamation difficult. This is a feature not before recognized, but as this has been fully demonstrated analytically and synthetically by the writer, and as the occurrence of this form of combination is very frequent in the Alaskan gold fields, it should be known, so that the difficulty presented may be the more easily dealt with.

Coarse gold may be saved by any of the numerous contrivances of riffles and pockets which constitute the invariable basis of every gold-saving machine that depends on gravity alone for its efficiency, but it is recognized by every miner of intelligence and experience that, notwithstanding the claims set forth by some projectors of such apparatus, a certain newly contrived stirring or a certain peculiar shaking "saves all the fine gold;" yet the fact remains that gold of such fine particles as that found on the beaches and tundras of Alaska can only be saved by amalgamation, and that by any other means not more than 50% or 60% can be extracted, even by the most careful working. It is also a fact that, while fine gold is often found disassociated from the coarse, yet where the coarse gold is found in any quantity the fine is discovered with it in almost equal value, so that in any case it may be seen that a thorough extraction involves amalgamation as at least a part of the process.

But, from what has been stated above, even amalgamation, as generally understood, provides a very imperfect process by reason of the unfavorable condition of the plates and of the surfaces of the particles to be amalgamated. In the recent form of "electrolytic amalgamation," however, the process may be said to have become perfected.

It has long been known that, under easily adjusted conditions of the electric current, metals in various forms and conditions might readily be amalgamated which, under ordinary circumstances, resisted that process. From this fact has gradually been evolved what might almost be called a new department in the science of electro-metallurgy. The system as now presented is not obscure. Electrolytic amalgamation follows closely the lines of other electrolytic processes. There is of necessity the positive and negative electrodes and the electrolyte through which these must react. Given the cathode of silver or copper, and, covered with mercury, a current such as will decompose water, is turned on. The flow of water carrying the sands, with particles of gold and mercury sufficient for its amalgamation, passes through and fills the space between the electrodes. All metallic particles in the fluid are drawn to the cathode, not only by gravity, but also in more or less degree by the course of the current flowing from the positive to the negative poles. But this is not all. By the decomposition of water, hydrogen is set free at the cathode and at once combines with the mercury on the plate and with the particles of mercury in proximity to that pole. A certain reaction takes place which much intensifies the amalgamating power so that even those surfaces, which under other circumstances are entirely indurated to mercurial affinity, now readily enter into combination with the quicksilver, and the particles of gold or silver amalgam become firmly adherent to the plates. When common salt is present, the action is still more pronounced. By the action of the current the salt is in certain small quantities decomposed and metallic sodium is formed on the cathode plate. This metal has a great affinity for both gold and mercury, and at once combines with both these metals, forming sodium amalgam and sodium gold amalgam. So intense is this action that the mercury appears to assume almost the fluidity of alcohol, and amalgamation takes place as with a flash. During this process, with an ample current of electricity, red litmus paper fastened to the cathode plate assumes a blue color, showing that some of the sodium has combined with the water to form caustic soda.

With the major reactions noticed, several other minor reactions take place. Where a combination of sodium has discolored and indurated the gold as found in the placers, the hydrogen amalgam at once combines to form hydrogen-sodium amalgam of gold.

Oxide films on the surfaces of the plates are at once decomposed, the oxygen entering into combination with the hydrogen to form water, while the reduced metals become amalgamated. A similar reaction takes place with the sulphide and alkaline coatings, and also with the carbonates, so that amalgamation may be produced under almost any condition.

Copper plates may be used for the cathode plates in electrolytic amalgamation, from the fact that under the electric current these are impossible of corrosion. When the current is discontinued, however, oxidation may take place, and for a few moments difficulty may ensue. It is therefore better, even in this process, that the plates be silvered. The anodes may be made of any suitable metal, not too easily oxidized and of fair conducting power.

Electrolytic amalgamation as described above is not only available for placer mining, but may be of great value as an adjunct of milling operations. It may be applied in a simpler form at little expense, and will enable operators to save considerable values that are now lost and make it possible to work certain ores which under other methods return no profits.

On the beaches and tundras of Alaska this season will find thousands of miners working with numberless antiquated and new-fangled machines, and by these crude ways immense quantities of gold will be extracted, but the heavy, steady output will come when these, having skimmed over the ground, are followed by the more scientific process of electrolytic amalgamation.

Chrysotile in diabase: Emerson shaft, Wildman mine, Sutter creek, Amador county, Cal.; W. H. Storms.

Selenite in very peculiar radiating groups of crystals: California.

Rich quicksilver ore, cinnabar and metacinnabarite: Spanish Belt, Nye county, Nev.; J. A. Yerington.

Pearl blue granite, cut and polished; A. L. Seager.

Gold quartz with bornite and chalcopyrite: Port Dick, Kenai Promontory, Alaska; Paul Buckley.

Gold quartz: Yun San mine, Korea; oldest mine in Korea; worked for 500 years to a depth of 400 feet; Col. J. E. Doolittle.

Auriferous pyrite rich in gold: from a large ledge on Selwyn river, Selwyn district, Yukon Territory, Canada; H. Marco.

Very fine specimens of molybdenite from a large vein which also carries gold and silver: Lake Chellan, Okanogon county, Wash.; J. E. Moore.

Gold quartz, high grade: from the mines of the Grass Valley Exploration Co., Grass Valley, Nevada county, Cal.; W. S. Keyes, M. E.

Black tourmaline in quartz and fine group of mica crystals: Grafton, N. H.; Chas. W. Livermore.

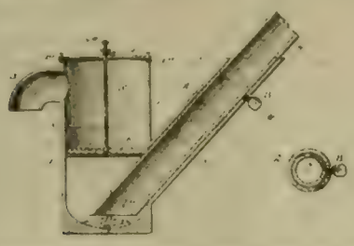
Gold quartz, rich in free gold: Michigan mine, near Gazelle, Siskiyou county, Cal.; Bert Martin.

Placer gold: from Anvil creek, Cape Nome, Alaska; J. M. Davidson.

Colemanite, pandermite, hydroboracite, etc.: from the new borate fields in Ventura county, Cal.; J. A. Comer. M. E.

Heavy wire gold in massive pyrite; a very uncommon and interesting specimen.

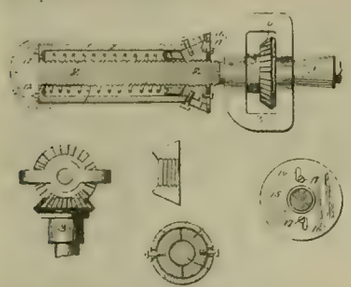
Talc and graphite of merchantable quality from Shasta county, Cal., and a number of other new specimens of cinnabar, copper ores, fossils, gold quartz, etc.



H. S. DURDEN, Curator.

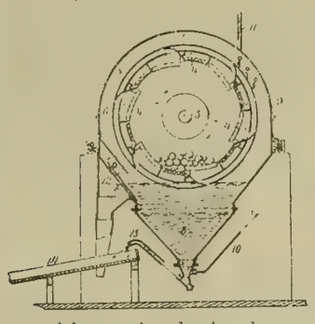
Mining and Metallurgical Patents.

Patents Issued April 10, 1900.



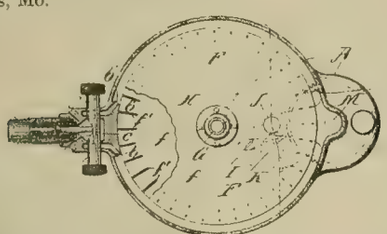
Specially Reported for the MINING AND SCIENTIFIC PRESS

AMALGAMATOR.—No. 647,011; A. L. Malone and H. Terwilliger, Portland, Or.



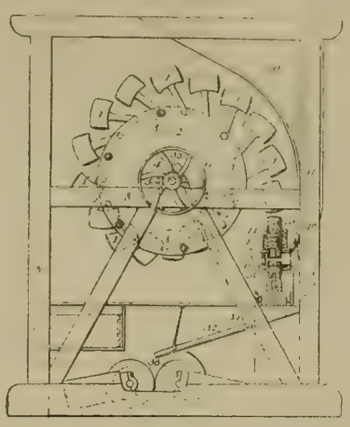
Combination with mercury holder having closed and internally concaved bottom, provided with detachable cap plate having boss, of horizontal flat sieve extending entirely across interior; vertically movable rod secured to sieve and projecting upward therefrom and through boss, provided with handle; holding device carried by boss and located to engage rod to thereby hold same and sieve in adjusted vertical positions; feed pipe, lower end of which is disposed below sieve; second and similarly inclined pipe telescopic in first-mentioned pipe, having its lower end disposed below sieve and its lower edge horizontally disposed; set screw carried by first-mentioned pipe, serving to engage and hold telescopic pipe.

BORING IMPLEMENT.—No. 647,311; W. T. Maxwell and G. J. Spahn, Baltimore, Md.



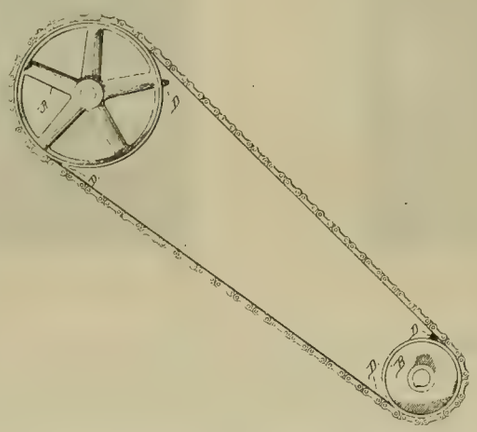
A boring implement, combination of right-angular frame 3, threaded bit-carrying shaft and driving shaft arranged at right angle, and meshing gears for rotating them, a tubular back bearing 9, a divided, or two-part, nut in which the threaded shaft works, the same being seated removably in the front end of such back bearing.

BALL GRINDING MILL.—No. 647,336; H. L. Sulman, London, England, assignor to F. Krupp, Magdeburg-Buckau, Germany.



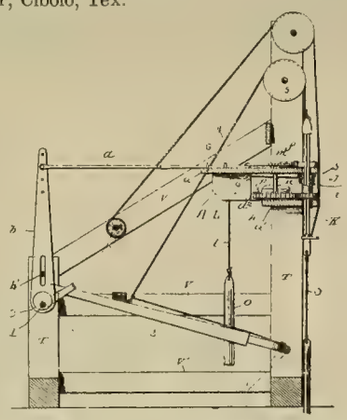
A mill comprising casing having lower part providing water trough, water supply pipe leading to lower part of trough, discharge pipe adjustable in length for regulating height of outlet and extending from lower part of trough beneath supply pipe, means for determining level of water in trough, and a ball drum having grinding plates, and mounted so as to dip its lower sieve part only in water contained in trough.

PNEUMATIC DRILL.—No. 647,265; J. A. Hoff, St. Louis, Mo.



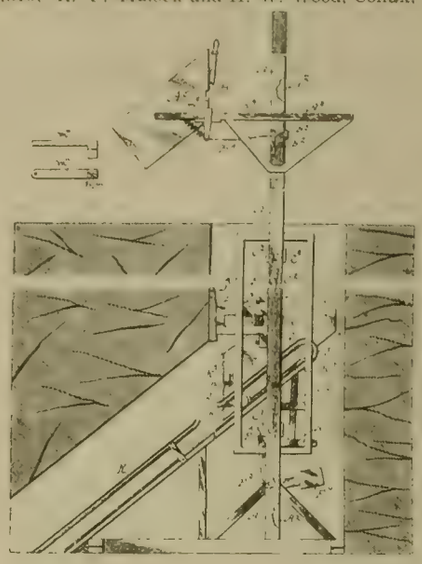
The combination with valve casing having suitable ports, of valve C having a V-shaped reduced portion, which reduced portion likewise establishes communication between central chamber and ports on each side thereof, a spring-pressed tooth mounted on valve C and a notched face on valve casing, with which spring pressed tooth co-operates.

STAMP BATTERY.—No. 647,057; M. Weber, Adelaide, South Australia.



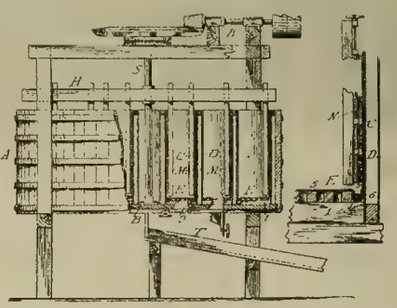
A stamp battery consisting of supporting frame, hammer wheel composed of a multiple of circular plates connected by bolts, multiple of swinging hammers hung on bolts and means for applying power to wheel in combination with stamp box of two compartments composed of oscillating anvil blocks forming bottom, plates forming sides, ends and top, and an intermediate plate, top and intermediate plate being provided with corresponding apertures, disconnected vertical stamps mounted in apertures of box provided each in its upper portion with collar, circular spring surrounding stamp between collar and intermediate plate, oscillating anvil blocks having each in its center a downwardly projecting stem and pivoted oscillating levers below.

CHAIN BELT GEARING.—No. 647,243; J. C. Anderson, Highland Park, Ill.



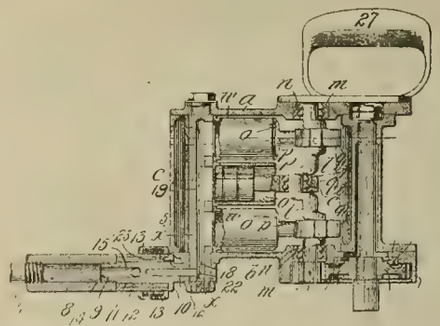
In a chain-belt gearing, a sprocket wheel having sprockets predeterminedly farther apart than pitch of chain links, in combination with a sprocket chain, links of which are uniform in pitch and the number of which is more or less than an exact multiple of number of sprockets on wheel.

WELL DRILLING MACHINE.—No. 647,348; F. R. Wiedner, Cibolo, Tex.



A well drilling machine, combination with frame, of main drive shaft mounted therein, casing carried by frame, rod k extending through casing and connected with drill rope, pinion i mounted on rod, having a drum j secured thereto, weight o attached to drum, mutilated gear h, meshing with pinion, ratchet f actuating gear, an oscillating lever actuated by main drive shaft, and rod d and pawl d′, operatively connecting the lever and the ratchet f.

APPARATUS FOR ELEVATING ORE FROM MINES.—No. 647,316; R. P. Mulock and H. W. Wood, Colfax, Ia.



Apparatus for elevating ore from an inclined shaft intersecting a vertical shaft, a cage consisting of a four-sided frame, an oblong frame fixed to the four-sided frame, projections at parallel sides of oblong frame adapted to engage parallel uprights in vertical shaft, double rails fixed in cage frame in an inclined position, auxiliary frames fixed to cage frame, roller mounted in auxiliary frames, and means for fastening cage at its bottom to parallel uprights in vertical shaft, arranged and combined to operate in the manner set forth, the cage having fixed inclined track rails, a car adapted to be supported on rails and provided with cam on its under side, hooks pivotally connected with parallel uprights in vertical shaft, lever fulcrumed to cage and adapted to be engaged by cam on bottom of car, frame connected with lower end of lever and adapted to engage hooks and means for normally retaining hooks in engagement with cage.

LEACHING TANK.—No. 647,358; D. W. Balch, San Francisco, Cal.

In a tank for the purposes described, and in combination, the tank wall, bottom, and perforated false bottom, vertical screens extending through false bottom, space between each screen and adjacent false bottom, textile covering for false bottom having edges turned into space, a textile covering for each screen having its edge turned into space, rope forced into space above textile edges for holding them in place.

PNEUMATIC DRILL.—No. 647,455; E. C. Meissner, St. Louis, Mo.

Combination with casing of spindle fixed therein and provided with inlet and exhaust ports, cylinders mounted on spindle, pistons in cylinders, crank shaft with which pistons engage, plug mounted on end of spindle and provided with ports in registration with inlet and exhaust ports of spindle, and rotary valve comprising sleeves 11 and 12, and a muffle 13, which are secured together and adapted to rotate on plug for admitting or exhausting pressure to or from either of spindle ports.

Southern Oregon Placer Conditions.

Written for the MINING AND SCIENTIFIC PRESS by THEO. F. VAN WAGENEN.

The hydraulic mines of the placer region of northern California and southwestern Oregon, near Galice in Josephine county in the latter State, are deserving of notice. The discovery of the extensive gold fields of this vicinity, extruding through the counties of Siskiyou, Trinity and Humboldt in California and Josephine and Jackson counties in Oregon, followed quickly upon the first rush into California in 1849. As early as 1850 gold was found in Althouse creek, one of the tributaries of the Rogue river; and for several years, while the tide of discovery was running high, the output of gold rivaled that of many parts of the more extensive auriferous region in central California. But the valleys of the Klamath and Rogue were carved out upon a different plan from those of the lower Sacramento and San Joaquin, the result of which was the deposit of much less alluvium along the former than the latter. In consequence, the primitive methods of mining in those days yielded large profits but a short time in the northern districts, and by 1855 the bulk of the roving population had drifted northward to the Columbia and Frazer rivers and eastward towards Idaho and Montana, where later equally rich discoveries were made.

The geological situation in the region under consideration is interesting. Where now stand the rugged and picturesque Siskiyou and Rogue river ranges, built up upon a massive core of serpentine and slate, there used to be in former geologic time a broad and deep inlet from the Pacific reaching as far eastward as southwestern Idaho. Into the head of this the Snake river, which now heads in Wyoming and empties into the Columbia, poured its floods. The coast lines of the ancient gulf may to-day be traced with considerable accuracy, and they indicate a comparatively narrow inlet from the ocean at about the region of the Oregon-California line; a broad interior basin with an average diameter of fully 500 miles, along which numerous bays extended in several directions towards the center of the continent, connecting probably with the Humboldt and Salt Lake basins and certainly with the region now known as the Snake river desert.

The series of seismic disturbances which later elevated the floor of this extensive gulf and covered much of it with vast beds and ridges of lava, forcing the Snake northward to a junction with the Columbia and sealing the outlets of the Humboldt and Salt Lake basins, is a story which when rightly deciphered by the geologist will prove not only interesting, but economically valuable; for, during these changes, very large marine deposits of auriferous conglomerates were formed in northern California and southern Oregon, not very dissimilar in character to those at Johannesburg, South Africa; and great dikes of auriferous diorite were thrust upward through the earth's crust near the present Pacific coast line; both of which have been the immediate source from which came much of the gold being at present recovered in this region.

One of these latter has been traced almost in an unbroken line through southwest Oregon, from Riddles to Waldo, a distance of forty miles. So persistent is this fissure and so straight its course—from N.E. to S.W.—that it probably marks the line of a fault plane; east of which the country slowly was elevated, while west of it there was as gradual a subsidence. Parallel to it and so close that the two may be said to adjoin—for they are never separated by more than a few rods—is what is locally called an ancient river channel, but which actually consists of a deposit of small breccia and soil from 50 to 150 feet in depth and from 500 to 2500 feet wide, through all of which gold is disseminated to such an extent that its yield when the channel is worked in large quantities averages between 15 and 20 cents per cubic yard with great uniformity.

As might be expected from its soft nature, this gold-bearing channel has been very extensively eroded and washed away. Wherever crossed by a river, a gulch or a ravine it is totally gone, while its golden contents have been caught and concentrated in some part of the newer channels below, or swept westward to the ocean, there to be thrown up on the beach and form the profitless diggings of the gold coast. Only fragments remain here and there; yet these fragments may be and have been traced and found by the prospector in his tramps across the country, and, whenever extensive enough to offer a commercial basis for a mining enterprise, have been taken up and are being worked.

In the vicinity of Galice, south of the point where the Rogue river has cut its way through the dyke to the canyon, the gold-bearing deposit, crossing the gorge diagonally, rests upon a slate bedrock 50 feet above the surface of the water.
